For thus diverting attention from the main issue Mr. Untermyer has been called to account in the daily press, the *Wall Street Journal* asking where else than in Wall Street any one would expect to find the stock. As that authority sees it, the stock is not an investment and has not been one since the company took over the bankrupt Metropolitan Street Railway nearly a score of years ago. It says that investors long ago took their losses and retired from an enterprise which, after brilliant entrance into its own field of long-distance transportation, had sadly blundered in its first plunge into "unification." It says:

> Certainly Mr. Untermyer does not harbor the delusion that either the ownership or the market price of the stock can have anything to do with the terms on which the city may or may not take over the company's property. But the divertissement with which the play opens is far from a waste of time, from Mr. Untermyer's point of view. It creates the invaluable atmosphere, or haze, through which the public may see the traction Caliban struggling desperately to free itself from Ariel's magic spell. Facts really bearing upon efficient transportation service, the value of the properties and the expediency of recapture can, if necessary, be brought upon the stage in the fifth act.

The almost unending details seem to have no place, certainly at this time, in an account such as this. But what is it all about? Well, the gist of the matter is that the Transit Commission has begun the series of public hearings in the hope of obtaining information and suggestions which will assist it in drafting a plan for the unification of the rapid-transit facilities of New York City. It is required by law to prepare such a plan. In advance of its public hearings it undertook to reach some basis of understanding with the companies by a series of private conferences. These were barren of results and served only to emphasize the many points of difference in the views of the negotiators.

The only possible relevancy of the questions of counsel with respect to ownership and stock values is that the latter is said to have been the chief obstacle to progress at the recent conferences. As has been pointed out, the task is made doubly difficult by the fact that any plan which is finally devised much be accepted by both the companies and the city. The commission is a state-created body, with no power in this case other than to investigate and to recommend. As the *World* sees it, unification cannot be effected through its agency unless all parties show a disposition to give and take; nor can it be accomplished if the transit question is again to be bedeviled with politics as it was under the Hylan régime. "The job, in short, cannot be done unless there is a vigorous display of common sense all around."

Announcement to this effect that the private conferences had failed was made on May 11 by Mr. Untermyer. He declared that the Interborough wanted the city to take over the Manhattan elevated lines, which it holds on a lease, but which do not pay, and that the B.-M.T. expressed its willingness to dispose of its surface lines to the municipality but wanted a guarantee of its earnings in perpetuity. Mr. Untermyer intimated that the companies were unreasonable in their demands. Recapture seemed to be the only answer, he said, if the companies remained in their present mood.

Gerhard M. Dahl, chairman of the board of directors of the Brooklyn-Manhattan Transit Corporation, said in reply that the negotiations between the B.-M.T. representatives and the special counsel of the Transit Commission were terminated by the latter. According to Mr. Dahl no valuations by the Transit Commission where shown or offered, nor was any plan suggested, excepting a determination to split up the B.-M.T. properties in order that the city might purchase such part as it might choose at some knock-down price not stated, without any intimation as to how or when the city could pay even for that. Mr. Dahl said:

> The function of the Transit Commission, as set forth in the law enabling it to act, and as again emphasized in its public letter of Dec. 13, 1926, namely, to formulate a plan for the unification of all transportation systems with a fair return to the companies and a fair return upon the city funds invested, was at no time permitted by counsel for the Transit Commission to enter the discussion.
>
> The B.-M.T. is now and always has been willing and anxious to do all in its power for the improvement of the transportation facilities of the city. There is, however, little encouragement in prospect so long as those acting for the Transit Commission refuse to consider real unification or feasible methods to improve the service or a fair return upon the fair value of the investments in the property, both by the companies and by the city.
>
> We have been at all times and are now willing to agree upon a fair value of our property and a fair rate of return upon that value regardless of securities issued or stocks outstanding and market or any other values.

At least one witness has proved refractory about answering questions deemed to be irrelevant, and on May 26 the authoritative statement was made that the commission and its special counsel will make a test case out of Thomas L. Chadbourne's refusal to answer. On advice of counsel Mr. Chadbourne declined to answer questions relative to details of his purchase of Interborough stock. He wants to go to Europe, and for that reason was called as a witness out of the scheduled order of the inquiry. If the commission decides to test his right of refusal while he is away, service will be made by agreement on his counsel.

All in all, the first week's hearings have developed little bearing on the central purpose of unification. It is, however, generally agreed, as the *Times* points out, that they have served to bring out one rather significant declaration. It has been widely believed that the companies' attitude toward valuation would be rather unbending, particularly in the light of recent court decisions stressing reproduction costs as the principal criterion of value. But ex-Governor Miller, counsel for the railway, at the outset made it clear that the B.-M.T., at any rate, had no preconceived notions on the subject and would listen to reason. He declared that his client would even be willing to submit to arbitration to secure a proper determination of the matter. That may have been a gesture, but at least it was a gesture in the right direction, for agreement on a valuation of the companies' properties offers one of the principal difficulties in the present negotiations.

Meanwhile, the hearings have been put over until May 31.

Fare Hearings in St. Louis Started—Valuation Case Deferred

The hearing on the application of Receiver Rolla Wells of the United Railways, St. Louis, Mo., for a flat 8-cent fare opened before the Missouri Public Service Commission at Jefferson City on May 17. City Counselor Muench has indicated a desire to present his testimony at a hearing later.

Before any testimony was offered Mr. Muench asked that the commission make it clear whether the matter would be confined merely to a question of the rate to be allowed the company or if the entire subject of valuation would be again discussed. He said that the city opposed a new valuation as one was practically completed in 1923 and the car riders of St. Louis should not be subjected to the great expense of a new valuation. It was his contention that the logical way to proceed to a basis on which to predicate a new fare was to take the 1919 valuation of $51,781,000 and add betterments and additions made since that time.

Thomas E. Francis, counsel for Mr. Wells, said that the fare application was not presented nor urged on the valuation theory, but is predicated upon the view that an 8-cent rate is necessary to earn a fair return upon the money invested, pay taxes and operating expenses.

Among the early witnesses presented by the company were W. B. Bennett, consulting engineer for the company; Albert S. Richey, Worcester, Mass., and Robert M. Fuestel, Fort Wayne, Ind., engineer and operator of public utilities. These witnesses testified as to the present physical condition of the company's properties so that the units established by the 1919 valuation might be used as a basis for establishing the worth of the property as at present.

The theory on which the company is building up its testimony is that the commission in conformity to a recent decision of the United States Supreme Court should allow the utility to earn on the basis of the reproduction cost of its properties new less depreciation. A maximum valuation claim of $100,000,000 less depreciation of 16 to 20 per cent would bring the value of holdings, exclusive of non-operating properties, to not less than $84,000,000. However, it does not expect the commission to allow this maximum figure and would be content with a valuation of $75,000,000 as basis for figuring rate of return. Its application to the commission contended that the fair valuation of its operating properties was $75,000,000 and that was the figure used when the fare question was before the federal courts a few months ago. It is $15,000,000 more than the reorganization committee has stated it would accept if the city would grant a new franchise to it.

On May 16 accountants for the Public Service Commission completed an audit of the betterments and additions made during the last two months of 1926. It brings the total since Jan. 1, 1919, to $6,425,943. Depreciation for this period was estimated at $8,469,729, being subdivided as follows: Way and structures, $4,064,376; power and plant, $910,643; equipment, $3,480,517; bus equipment, $14,201.

Recently the commission appraised the property at $58,177,260.

Electrification Plans of New York Central Divulged

The New York Central Railroad will develop power in its own generating stations at Yonkers and Port Morris to supply its contemplated electrification on the west side of Manhattan Island, according to statements made by railroad officials to the press. Between 30,000 kw. and 40,000 kw. will be required for track now being electrified between Spuyten Duyvil and 72d Street. Plans for electrifications below 72d Street are still under discussion.

At the present time the New York Central has two power stations in the New York district. The largest of these is at Port Morris, in the Bronx. Here 70,000 kw. can be generated, and the major portion of the energy needed for the passenger lines of the company running north out of the Grand Central Station is supplied from this station. The second power station of the company is at Yonkers, where there is a capacity of 20,000 kw. This plant will be doubled, the new equipment being added probably within two years.

The railroad does not, it is announced, expect to purchase any power from the local companies for any part of its extensive electrification program. Current will be fed to the lines of the railroad on the west side from three substations, each with a capacity of 5,000 kw. These stations will change the current from 11,000 volts alternating to 600 volts direct. One of these substations will be at Dyckman Street, another at 133d Street and a third at 66th Street.

The electrification of the west side line of the New York Central has been the subject of negotiation between the railroad and the city for a long time. In the present instance the work is being combined with the elimination of numerous grade crossings.

New York State Men Vote Against Wage Renewal

Employees of the New York State Railways in Utica, Rochester and Syracuse in joint balloting on May 25 voted down by a majority of 133 the proposal to renew the existing wage and working agreement with the company. Bargaining was resumed between James F. Hamilton, president of the railway, and union officials. Another vote may be taken on the same proposal before resorting to arbitration. The employees voted twice last year on the same proposition before accepting it. It was stated that the vote in Rochester favored renewing the present contract, while Utica and Syracuse, where fares have been increased to 10 cents, cast the ballots that led to its defeat.

The present wage scale is 55 cents for two-man car operators, 58 cents for one-man operators and 60 cents for interurban men. The men had asked for a 9-cent an hour straight increase. The company contends employment conditions and high cost of maintenance preclude any wage increase.

Chicago Rapid Transit Employees Renew Wage Demand

Hearings on the question of a wage increase of 15 cents an hour for 5,000 employees of the Chicago Rapid Transit Company were scheduled to begin this week, following presentation of a formal demand to officials of the company by Frank E. Lawrence, president of the Chicago elevated division of the Amalgamated Association. The present wage ranges from 72 to 77 cents an hour under an agreement which expires May 31. Although official announcements have not been made, it is understood that the company, instead of entertaining the demands of the union, will seek a reduction in wages and will also negotiate for changes in working conditions.

Similar demands upon the Chicago Surface Lines are momentarily expected from 15,000 platform and other employees. Since June 1, 1926, the Surface Lines employees have been working without a contract, as they failed to reach an agreement with the company at that time, when, together with the elevated workers, they demanded an increase of 5 cents an hour.

Survey Recommends Changes in Birmingham Traffic

Recommendations looking toward a solution of the traffic ills in Birmingham, Ala., have been forwarded to the City Commissioners as a result of an intensive survey conducted by Ross W. Harris.

Among the changes sanctioned by the city commissioners was a complete rerouting of car lines of the Birmingham Electric Company so as to distribute more evenly the loads carried by certain streets, prohibition of any parking on Second Avenue from Eighteenth to 21st, and the abandonment of Avenue C and Terminal station. The date when these changes are to go into effect has not been settled, but the commission plans to set a "zero hour" when all changes will be made on a certain day. Ordinances providing for the changes have already been drafted by Mr. Harris and City Attorney W. J. Wynn and submitted to J. M. Jones, Jr., president of the City Commission.

J. S. Pevear, vice-president and operating head of the Birmingham Electric Company, said that orders for new track, curves and other necessary facilities for carrying out the utility's part of the suggestions had been placed. The work of placing trackage to facilitate the rerouting will begin as soon as the orders are filled.

Commission Hopes for Adjustment in Buffalo

Under a plan advanced at Buffalo, N. Y., the Public Service Commission will consider not only the fare question, but track reconstruction and other matters in the transit situation over which there have been differences of opinion between the International Railway and the city. It is understood that after a program has been prepared, the commission will submit its proposal to the city and company for criticism. If overtures to act as arbiter in the matter are rejected, it is said that the commission will render a decision itself.

It is pointed out that not only must the commission consider the fare case by itself, but that it must view all angles of the situation. These include the city's application for an order to reconstruct many miles of roadbed, the counter application of the company for a rehearing of the Grant Street case, inasmuch as the city has moved to revoke the franchise. A commentator said:

> In viewing the proposition as a whole, it is likely that the commission will insist upon a track reconstruction program. Whether this will involve an increased fare is uncertain. It depends upon additional studies being made of the company's financies by commission experts.
>
> It is probable that in taking a comprehensive view of the matter, the commission also will give thought to the company's application to abandon portions of certain car lines and to substitute buses.

Amended Fare Schedule in Los Angeles Authorized

In a supplemental order the California Railroad Commission has authorized the Pacific Electric Railway to amend on one day's notice its experimental rate schedule, now in force between Los Angeles and points on its Glendale-Burbank line, as follows:

1. Publish between Los Angeles and Cypress Street a 30-ride family commutation fare of $3.25.
2. Reduce the present 30-ride family commutation fare between Los Angeles and North Glendale from $4.80 to $4.50.
3. Publish between Los Angeles and Pacific Avenue a 30-ride family commutation fare of $4.50.
4. Publish between Los Angeles and Allen Avenue a one-way fare of 20 cents, round-trip fare 35 cents, and 30-ride family commutation fare of $4.80; between India Street and Allen Avenue a one-way fare of 15 cents, round-trip fare 25 cents, and 30-ride family commutation fare $3.60; between Richardson and Allen Avenue a one-way fare of 10 cents; between Glendale (East Broadway) and Allen Avenue a one-way fare of 10 cents, and between Arden Avenue and Allen Avenue a one-way fare of 6 cents.
5. Publish between Cypress Street and North Glendale and between Cypress Street and Hahne a one-way fare of 6 cents.
6. Eliminate from the tariff all one-way, round-trip, 30-ride and 60-ride fares now published between Los Angeles, India Street, Richardson, Glendale (Broadway) and Glendale (East Broadway) on the one hand, and on the other Senorita, and between Los Angeles and Western Avenue.

Aurora Line Publishes Booklet for Suburban Home Seekers

Advantages of a home in one of Chicago's many beautiful western suburbs and the convenience offered commuters by its high-speed electric train service are among the features set forth in an attractive pamphlet recently published by the Chicago, Aurora & Elgin Railroad, Aurora, Ill. Information regarding educational and religious institutions, shopping, banking and recreational facilities, public utility services in every community along the railroad is contained in the 23-page booklet, which is entitled "Facts About the Western Suburbs and the Fox River Valley." It is illustrated with numerous pictures of scenic points in that territory.

The booklet is addressed particularly to the city dweller who desires to make his living conditions better. It is being distributed through hotel information desks, newspaper service bureaus and at all stations of the railroad.

New York Interurban Satisfies Needs of "Fans"

Offering the baseball enthusiasts of Jamestown, N. Y., and adjacent communities an opportunity to witness some of the major league baseball games played in Cleveland, Ohio, at a special excursion rate of $3.75 for the round trip is one of the many moves of the Jamestown, Westfield & Northwestern Railroad to stimulate its revenue.

Several years ago this line operated its first Sunday excursion to the Ohio city. For the initial trip more than 2,000 persons purchased tickets. Similar excursions have been operated at regular intervals since and the company now makes a regular feature of these excursions during the early spring and summer months.

The Jamestown, Westfield & Northwestern has its northern terminus at Westfield, N. Y., where it connects with the main line of the New York Central Railroad. Every available car of the former is pressed into use on these feature excursions. On reaching Westfield the passengers are transferred to a special steam train on the Central tracks, whence they are transported to Cleveland, without further stops.

The regular one-way fare between the two cities via the route mentioned is $5.34. The cars are started out of Jamestown in the early hours of Sunday morning and the return trip is made late the same evening. Due to the low-peak hours the excursions are operated, there is little or no interference with regular passenger travel and even though the reduction in rate is exceptional, both the trolley line and the steam line are enabled to increase their revenues.

The first excursion of 1927, advertised in the local newspapers for several days preceding, was on May 15.

Settlement Sought by Company at London

The London Street Railway, London, Ont., has agreed to relay its tracks in London West with new steel rails on steel ties and a concrete foundation. It has also agreed to install a passing switch and a loop or a three part "Y" in a suitable location. The company's acquiescence in this matter is contingent upon the passage of the following by-laws by the City Council:

> (1) Amending by-lay 916, authorizing the 5-cent fare in place of the seven and nine tickets for 25 cents as provided under subsection D of section 25; (2) a by-law amending by-law 916, granting the right to the company to operate ten additional safety cars, or a total of fifteen safety cars, with one employee in place of using two employees on each motor car as provided for under subsection H of section 25; (3) a by-law covering relief from the cost of paving the track allowance as provided for under section 10 of by-law 916, except that the company pays for the cost of laying the concrete foundation under the ties up to the normal line of paving.

According to Manager L. Tait, immediately after the passing of the necessary by-laws and their acceptance by the company, orders will be placed with the steel companies for the steel rails, ties, and the special trackwork required and the work it is estimated can be started within five weeks after the placing of the orders for the materials.

Proposal for Use of Canal Bed in Newark

A definite proposal regarding the financial arrangements between the Public Service Railway and the city of Newark, N. J., for the use of the Morris Canal bed as a rapid transit line was contained in a letter written by T. N. McCarter, president of the railway, to Mayor Raymond and recently made public. Mr. McCarter suggests that the city at its own expense and at an estimated cost of $4,000,000 prepare the canal bed for its subway use and also erect under the proposed new Pennsylvania station an adequate and up-to-date terminal station with all the necessary equipment, including track space, platform and escalators. His plan stipulates that a lease be entered into with the Public Service Railway under which that company would pay to the city 5 per cent of the gross revenue derived from operation of the subway line. Besides, according to the letter, the Public Service Railway would be willing under this plan to expend approximately $850,000 for making the necessary connections to the existing Public Service line, equipping the subway structure when completed with rails and overhead construction for operation. It was further proposed that the railway would be willing to finance the $4,000,000 expenditure with the understanding that the annual carrying charges on that sum be deducted from the 5 per cent tax to be made to the city by the companies.

Mr. McCarter said that he was confident the development would increase the traffic, "resulting, therefore, in substantially increased payments to the city under the 5 per cent tax requirement, which extra payment will constitute the rental to the city for the privilege."

Justifies Ventilation System in Toronto

The Toronto Transportation Commission declared that its ventilating system can exhaust air faster than a throng of 3,600 people jammed in Massey Music Hall could breathe it out from their lungs. In the *Coupler*, under date of May, 1927, referring to the publicity given during the past month to the provincial health law limiting the number of passengers to be carried by a street car, the commission stated that when it realized that poor ventilation was a menace to Toronto's citizens more than $100,000 was spent installing efficient ventilating systems similar to those used in the new steel cars. When the commission took over the system six years ago and adopted the motto "Safety, Courtesy and Service" it was concluded that safety should not only include prevention against accidents but also against germs. Thus it was that every street car order was designed so as to provide the best of ventilation. The commission states that it makes no attempt to conceal that at times, particularly on rainy days, cars may have slightly unpleasant odors, emanating from the wet clothing of passengers. However, it claims, it would not be possible to arrange a ventilation system which would eliminate these odors.

News Notes

Rates Advanced.—The Arkansas Valley Interurban Railway, operating from Wichita to Hutchinson and Newton and serving intermediate points in Kansas, has been granted an increase in passenger rates by the Public Service Commission. The new rate, effectiv May 22, calls for 3.6 cents a mile instead of 3 cents. The interurban is now on the same basis in this respect as the steam roads.

Change in Ticket Fare in Danville.—The Danville Traction & Power Company, Danville, Va., has been denied the 8-cent fare which it recently sought. C. G. Holland, president of the company, asked for a franchise amendment to permit the corporation to raise the fare from 7 cents. As a compromise, however, the company is permitted to sell four tokens for 25 cents, instead of five for 30 cents, as at present.

Special Cars for Summer Outings.—The Reading Transit Company, Reading, Pa., has invited its patrons to prepare for their family outings in the summer months by transportation on the street cars. All the parks in Reading and vicinity that are especially popular with picnic parties are now being prepared for the public's use. Special service will be provided for summer picnics and the company urges all to fix the date in advance so as to avoid the likelihood of conflict with outings of other organizations.

Single Fare to Park for Summer.—The City Council of Fort William, Ont., has authorized the charging of a single fare to Chippewa Park for the summer to promote traffic on the park entension line of the Fort William Municipal Railway. An experiment was made with a single fare to the park in August, 1926, but it was not altogether successful, mainly on account of weather conditions. The Trades and Labor Council took the matter up for this year.

Would Sell Land.—The San Francisco, Napa & Calistoga Railway has applied to the California Railroad Commission for authority to sell a small parcel of land in the city of Vallejo, comprising a portion of its right-of-way abandoned for a new location.

Advances in Wages Approved.—Wage increases were approved by the City Council of Edmonton, Alta., for the motormen-conductors of the Edmonton Radial Railway. They became operative as of April 1. The commissioners' report stated that the change involved a 1-cent increase an hour in each case on the present classification up to the fourth six months. It was further urged in the report that an additional class should be added for the fourth year and thereafter at 67 cents an hour, the highest at present paid being 65 cents. The adoption of this additional class would apply to approximately 80 per cent of the motormen at present in the service and amount to an increase of 2 cents an hour to the bulk of the motormen. The effect of the increase granted is to add about $15,000 a year to the wage accounts. The men's request for the fixing of an eight-hour day instead of a nine-hour day as at present was withdrawn.

Will Refund Car Fare.—When cars of the Nashville Railway & Light Company, Nashville, Tenn., stop before the Capitol Theater from May 23 to May 28, M. B. Thomas, manager, will meet the riders at the theater entrance and refund to them their carfare to and from the Capitol, so anxious is the Capitol management that every Nashville person should see Colleen Moore in "Orchids and Ermine." All that is asked of theater patrons is that they clip the coupon on "Read as You Ride," the pamphlet of the railway, and present it for refund when buying theater tickets.

Stars for Car Men.—Four more employees of the Jacksonville Traction Company, Jacksonville, Fla., have been awarded gold stars, representing twelve months of operation without a chargeable accident. An announcement to this effect was made recently by E. Q. Brown, superintendent of transportation. The four men completed their accidentless period in April.

Investigation Invited.—Mayor Frank B. Lovelace of Poughkeepsie, N. Y., recently sent a letter to the management of the Poughkeepsie City & Wappingers Falls Electric Railway notifying it of unpaid paving warrants amounting to $242,883, including interest and penalties. Without these items the debt would be about $190,000. Ralph F. Butts, attorney for the company, stated that the railway business, like other industries, had felt the general increase in costs of labor and materials caused by the war and had not been able to adjust its rates. For this reason it had to seek relief from the Public Service Commission on various occasions with the result that the fare, which had been 5 cents, was finally raised to 10 cents. However, the company finds itself unable to pay the paving bills at once and would like to have a committee of business men tell it what it would do if it were placed in the railway's position. Full financial statements are open for investigation. In conclusion, he said that the company's plight was a community affair.

Company Goes "On the Air." — A quartet of male voices sponsored by the Washington, Baltimore & Annapolis Electric Railroad, Baltimore, Md., was heard on May 13 over station WRC at Washington. Hereafter the quartet will be heard regularly every Friday night at 8:30 o'clock over the same station. The company resorted to the radio in "putting over" the new articulated cars. A radio announcer told all his listeners that it had spent half a million dollars in installing this service in Baltimore, "the first high-speed articulated, all-steel electric express cars on any interurban railroad in America." The announcer also said that the company had recently established a luxurious motor coach line between Washington and Annapolis over the new National Defense Highway. It was then made plain that the railroad was distributing a free booklet to summer cottages and bungalows in colonies near its lines.

Recent Bus Developments

Buffalo & Erie Agreement with Bus Company Ratified

The Public Service Commission on May 20 approved the petition of the Jamestown-Dunkirk Transit Company, Inc., for amendment to its certificate permitting a change in its route in Dunkirk and also approved an agreement entered into on March 1, 1927, between the petitioner and the Buffalo & Erie Railway, ratified by the city of Dunkirk on March 29, 1927.

According to the agreement the railway will not oppose the amendment of the bus line's certificate, provided it will be effective only for the term during which the agreement shall remain in force; that upon the termination of the agreement the bus lines shall automatically revert to their present routes. Other provisions stipulate that the railway shall furnish to the bus line a supply of transfers good for passage on the railway line in Fredonia and Dunkirk, and shall be entitled to receive from the bus line 10 cents for each transfer honored by it; that the railway and the bus line shall maintain the time schedule of buses and railway service agreed upon between them. It is arranged that the parties will establish, as soon as permission can be obtained from the commission, a joint excursion return trip rate between Lily Dale and Buffalo at $2.75 good in either direction, and a like rate between Buffalo and Jamestown of $3.88, good in either direction.

The agreement is to continue in force until terminated by either party giving to the other 90 days notice, except that in case of violation of the agreement either party may terminate upon ten days notice, specifying the ground of such termination.

Nebraska Operators to Appear on Bus Law

The Nebraska Railway Commission has cited all operators of intertown buses to appear June 8 and show cause, if any, why certain rules and regulations set out in the order shall not be adopted. The Legislature passed a law that becomes effective on July 24, giving the commission powers of regulation except as to rates of fare and the issuance of certificates of convenience and necessity. Previously the state regulatory body has acted under its general powers, but has confined its supervision largely to safety regulations and a requirement for liability insurance to passengers and their property.

The commission indicates that it will forbid any changes in schedules or routes in the future until after application, hearing and order. It will also make a similar ruling with reference to abandonment of a route after it has once been established. The commission will present a new form of insurance policy. The present requirement is for a minimum of $5,000 with a total liability for one accident of $10,000 for seven-passenger buses and with a maximum of $50,000 for 40-passenger capacity vehicles. The maximum will be raised, but the commission will insist that rates be so adjusted as not to be excessive.

Joliet Line Would Substitute Taxis for Unprofitable Bus

Permission to reduce its regular all-day motor coach service between Lockport, Ill., and the new Illinois State Penitentiary at Stateville to three or four round trips during morning and evening rush hours, and to establish taxicab service during the middle of the day, when traffic is light, and at regular taxi rates, is asked in a petition filed recently with the Illinois Commerce Commission by the Chicago & Joliet Electric Railway. The hearing was scheduled for May 25 in Joliet, Ill. According to the company's application, the motor coach line was established at the request of prison commissioners to accommodate workers engaged in construction of the new penitentiary. Since the structure was completed early this year, however, the number of workmen has been reduced and operation of the 2½-mile line is being carried on at a loss. The motor coaches connect at Lockport with the company's interurban cars operating on an hourly headway between Chicago and Joliet.

Bridge Tolls for P. R. T. Buses Increased

The Delaware River Bridge toll charged single-deck buses of the Philadelphia Rapid Transit Company, Philadelphia, Pa., was increased from 25 cents to 50 cents per trip and the double-deck bus rate was raised to 75 cents, from the old rate of 40 cents, at a meeting of the Bridge Joint Commission on May 20. Independently operated buses, which have been paying a rate of 40 cents, will be charged 50 cents when the new rates become operative July 1.

Several of the commission members favored increasing the rates to 75 cents for the single-deck buses and $1 for the double-deckers, it was said after the meeting. The new rates were decided upon as a compromise. Bridge Commissioners estimated the new rates would increase the annual bridge revenues by $250,000.

Notice was served on the Penn-Jersey Rapid Transit Company, a P. R. T. subsidiary, which operates the bridge buses, that the rates would be increased upon expiration of the company's agreement on July 1. Independent operators also had been notified a general increase would go into effect. Passenger car rates were not changed.

Bridge officials said the first agreement was for one year only and was adopted merely as a tentative schedule. It was found the rates were out of line with toll charges on bridges in other sections of the country.

Bus Routes Proving Popular in Buffalo

Bus routes recently established by the International Railway in Kenmore and Tonawanda, N. Y., have proved so popular that additional buses had to be bought to meet the demand for service. Riding on the Buffalo city routes has also steadily increased, making the purchase of additional equipment necessary. Early this year the company placed an order for 24 gas-electric buses. The first of this order will be shipped within ten days. Last year 25 buses were bought and completion of this latest order gave the International Railway subsidiary a fleet of 81 buses, most of them of the modern gas-electric type. Five of the latest order will be of the de luxe style, seating 27 passengers and a special design for interurban and chartered service. Nineteen will be of the standard city type seating 33 passengers.

Additional express service, such as is now provided for North Buffalo and Kenmore during morning and evening rush hours, is being considered by the company and President Yungbluth has invited suggestions from riders as to the time when such service will be most helpful.

"Sho-Li-Mo-Co News" Chosen for House Organ Name

As a result of a recent contest among employees, "Sho-Li-Mo-Co News" is the name which has been officially adopted by the Shore Line Motor Coach Company, Gary, Ind., for its monthly employee magazine. The March number, which is the first issue to carry the new name, is the third which has been published by the company. The paper is edited by Don Bell in conventional newspaper style and consists of four pages of three columns each. It is 8½ x 11 in. and attractively illustrated with pictures of various employees and of buses and other properties of the company.

Buses Not to Replace Interurban

The Massachusetts Supreme Court has ordered dismissed the petition of Franklin P. Miller, receiver of the Boston & Worcester Street Railway, South Framingham, Mass., for permission to discontinue railway service on that line and to substitute buses. Judge Braley made this decision after he had been informed that the business of the company had improved considerably since Jan. 1.

Buses Substituted.—The New York & Stamford Railway, Stamford, Conn., has been authorized by the Public Utilities Commission to discontinue the operation of its railway between Atlantic Square, Stamford, and the New York State line. The petition of the company in which it sought to substitute bus service was recently heard and the commission gave its decision May 11. To operate the bus service the County Transportation Company, Inc., has been organized as a subsidiary. The commission granted permission to operate buses between Stamford and Port Chester, N. Y., and sanctioned a zone charge of 10 cents for the two-zone line. On the railway there were three zones with a 7-cent zone rate. The commission denied a petition by the County Transportation Company for a line between Greenwich and the state line.

Ready for Special Parties.—The Worcester Consolidated Street Railway, Worcester, Mass., has announced that it is equipped to take care of special parties in de luxe motor coaches. Employees are requested to act as salesmen in promoting this service for church picnics, beach trips and other social functions.

Bus Service Increased.—In line with its policy of extending transportation facilities to serve where traffic requirements warrant, the Winnipeg Electric Company, Winnipeg, Man., on May 16 instituted bus service on Ellice Avenue. Buses operate on a 7½-minute headway during normal periods of the day with extra service for the rush hours to provide for a five-minute headway.

Plans for Selby-Lake Bus Line.—A 12½-cent fare for local passenger traffic on the Selby-Lake bus line was agreed on by officials of the Twin City Rapid Transit Company and St. Paul Council members and steps have been taken to have the Railroad and Warehouse Commission approve the plan. As a result this line, already largely a local transportation convenience for residents along the route, will be developed for short trips as an auxiliary to the railway. The plan is to establish the token system on the Selby-Lake line, with two tokens at 25 cents. It will be a pay-enter pay-leave arrangement. Adequate service to meet the needs was promised by T. Julian McGill, vice-president and general manager, if the new plan results in increased patronage.

Buses Replace Cars.—The City Council of Moline, Ill., has authorized the Tri-City Railway to abandon railway service on its Stephens Park line and substitute buses. Similar schedules will be maintained.

Scores Bus Line for Infringing on Railway Territory.—The Public Service Commission has issued an order to John Fabia to show cause why the certificate issued to him Oct. 16, 1924, for a bus line from White Plains to Mount Kisco should not be revoked for violation of its terms. The Westchester Street Transportation Company, Inc., operates railway service in White Plains and one of its lines, known as the Silver Lake line, operates from a point in the town of Harrison to White Plains. The Fabia bus route practically parallels the Silver Lake line of the railway. To prevent competition between the bus line and the railway, a clause was inserted in the certificate issued to Mr. Fabia providing that no passengers should be taken on or discharged along the route operated by the railway or within 200 yd. thereof for rides which begin and end within these limits. Affidavits filed with the commission show that Mr. Fabia is taking on and discharging passengers along the Silver Lake line in violation of the terms of his certificate and also that he is not operating a portion of his route in White Plains over the route prescribed in the certificate.

Financial and Corporate

Gary Railways Would Issue $300,000 Equipment Trusts

Approval of the issuance of $300,000 par value of equipment trust certificates dated June 1, 1927, and maturing in ten annual installments beginning June 1, 1928, is asked of the Indiana Public Service Commission in a petition filed May 17 by the Gary Railways, Gary, Ind. Certificates maturing during the period from June 1, 1928, to June 1, 1932, will carry an annual interest rate of 5 per cent while those falling due thereafter will earn 5½ per cent dividends. They are to be sold at a price of not less than 94 per cent of par value.

The proceeds derived from the sale of these securities will be used to finance in part the purchase of a total of 22 double-truck motor cars. Twelve of the cars have already been acquired and are being operated by the railway, while the remaining ten are now in process of manufacture. The equipment designated will be leased to the company by a trustee at a rental sufficient to cover the interest and principle of the certificates, together with taxes.

Plan to Reclaim Part of Washington-Virginia Road

Faced with the possibility of abandonment of service in the near future on the Falls Church-Fairfax division of the Washington-Virginia Railway, sold at auction recently, leading citizens of that territory are making an effort to form a company to take over the line to insure continued service and to preserve the rail facilities as a factor in the future development of nearby Virginia. To this end Thomas R. Keith of Fairfax and M. E. Church of Falls Church have obtained an option until June 1 under which they have the opportunity of acquiring the Falls Church-Fairfax division for $150,000, the amount it brought at auction.

C. R. Hinchman, Philadelphia, from whom the option was obtained, has indicated an unwillingness to continue operation of that part of the system after June 1.

The Mount Vernon division of the railway, which passes through Alexandria, was disposed of as a separate unit at the auction, and Gardner L. Boothe, representative of the present owners, said no definite plans have been made for the future of that line.

The sponsors of this effort to have the people along the line to Fairfax organize it for the benefit of the community is stated in this outline of the plan:

> The purpose of the purchase of this road is to insure continual operation between Washington and Fairfax; not with the expectation of profiting on the operation of the road, but for the benefit of the patrons and those dependent upon it for transportation, and to insure its operation strictly in the interest of the patrons, devoting the income as far as possible, after a reasonable return upon the investment, to the betterment of the transportation facilities. No watered stock, excessive salaries or financing operations will be charged against the road.

$1,081 Surplus in April in Cincinnati

Decreasing loss in the motor coach operation of the Cincinnati Street Railway, Cincinnati, Ohio, was shown in the statement for April. The statement reveals a deficit of $11,066, against $12,643 for March, 1927, and $14,839 for April, 1926. Reduction in the length of one of the poor paying runs and changes in fare zones are the chief causes for this improvement. The deficit in coach operation for April was absorbed in the revenue from street cars, with a resulting surplus of $1,081 on the combined operation.

Operating revenue	$728,847
Operating expense	534,589
Net operating revenue	$194,257
Taxes	62,872
Operating income	$131,384
Non-operating income	1,811
Gross income	$133,196
Interest, sinking fund and return on capital	132,115
Surplus	$1,081
Total in fare control fund March 31, 1927	424,639
Total in fare control fund April 30, 1927	$425,720
Revenue passengers	8,498,892
Transfer passengers	2,651,239
Free passengers	128,041
Total passengers carried	$11,278,172

In submitting his statement to E. D. Gilman, Director of Public Utilities of Cincinnati, President Draper, in mentioning the expenditure for track reconstruction, stated that the amount expended in general account, way and structures, largely made up of track reconstruction, was just a little less than $100,000; that there was charged directly to operating expense in this account more than the month's regular proportion of the cost of replacements and renewals of track as provided for in the program for track rehabilitation.

Receivers Discharged in Kansas City

Francis M. Wilson and Col. Fred W. Fleming have been discharged as receivers of the Kansas City Railways, Kansas City, Mo. The final decree was entered by Judge Kimbrough Stone, who made the original appointment in October, 1920. The two receivers turned over the railway months ago to the Kansas City Public Service Company, but they were continued in office pending the working out of certain details of closing the six-year receivership.

Even the final discharge contains reservation under which Judge Stone

EARNINGS AND EXPENSES OF MONTREAL TRAMWAYS

Revenue:		1926	
Passenger earnings		$12,573,383	
Miscellaneous earnings		317,425

*Interest on additional capital expenditures	460,336	
Interest on working capital	3,915	
Total	$2,641,429	
Which together with the operating profit of $55,276 and interest on investment in bus service of $32,916 constitutes the company's revenue from the contract.		
For expense of financing—one-half of 1 per cent of the sum of $36,286,295 is allowed annually to the company to cover the expense incurred in procuring additional capital. This amount is carried direct to "Reserve for Financing."	181,431	
To the city of Montreal:		
Rental for the period twelve months ended Dec. 31, 1926	500,000	
Balance	68,261	
		$3,391,122

*The additional return of 1 per cent per annum provided by the contract payable for a period extending not more than five years beyond the close of the World War was discontinued Sept. 30, 1926.

can rename the two or appoint other receivers in the event litigation makes the existence of duly authorized receivers necessary. There still is pending an appeal by the old second mortgage bondholders from the foreclosure and form of decree. They seek a judgment against the property.

Montreal Does Well

Tramway in Canadian City Earns 16.98 Per Cent on Its Capital Stock —Earnings for Ten Years Compared

In view of the continuing increase in population and the resulting traffic congestion the Montreal Tramways, together with the Montreal Tramways Commission, has continued to study a definite plan which would not only materially relieve the present congestion but would adequately make provision for future conditions. The directors expect in due course to submit to the civic authorities a general plan of improvement, embracing subways and elevated railways, which, together with the other means at the disposal of the company, will provide efficient and rapid transportation consonant with the growth of the city. These statements were made by Julian C. Smith, president of the Montreal Tramways, Montreal, Que., in the annual report submitted at the annual general meeting held on March 29, 1927.

This for the year ended Dec. 31, 1926, reflects further progress. Net income earned on the $4,000,000 of capital stock was equivalent to 16.98 per cent, compared with 8.03 per cent for the half year ended Dec. 31, 1925, and 15.59 per cent for the year ended June 30, 1925. Up to June 30, 1925, the fiscal year of the company ended in the middle of the year, but a change was then made so that the fiscal and calendar years would coincide and in consequence the report preceding the present one was for a period of six months ended Dec. 31, 1925. Passenger revenues were at a new high level, being shown at $12,573,383 compared with $12,145,440 for the previous full year, which was the former record. The bus service shows a net profit of $8,793 after deduction of interest on investment and other charges and operating expenses. This result compares with a net deficit of $498 on the bus service reported in the statement for the second half of 1925.

During the fiscal year the number of buses in operation has been increased from 24 to 55. The report pointed that the bus service is only on trial and that the increased service was given with a view of meeting the wishes of the public and in an endeavor to relieve the traffic congestion.

The proposed reorganization of the employees' mutual benefit association came into effect as of May 1, following a thorough study and discussion of the scheme by the employees. Under this arrangement the employees are now provided with substantial sick and injury benefits and pension and death benefits in keeping with present-day conditions. During the year the agreement with the employees covering their wage schedule was extended upon similar conditions to July 1, 1930.

During the year $1,000,000 of the common stock of the company was issued to the shareholders at a price of $125 per share, shareholders receiving one share of new stock for each four shares held at the close of business on Oct. 15, 1926. There has been paid in on account of this issue $649,718. The balance due became payable on March 31, 1927.

The accompanying report for the year 1926 shows the results obtained from the operations under the contract with the city, and the share of the gross revenue accruing to the company under the provisions of the contract and the disposition of same.

The gross revenue for the year accruing to the Montreal Tramways from

Rate Making Versus Sales Value Defined

United States District Judge Faris, sitting as a member of the United States Circuit Court of Appeals in the Denver railway case, has concluded that the valuation of a public utility for rate-making purposes may be much greater than its actual or market worth.

At the request of the receiver of the Denver Tramway the United States District Court at Denver fixed a rate-making valuation that was in excess of the claims against the company, both secured and unsecured, when the receiver took charge of the property. On that ground a group of creditors undertook to overthrow the reorganization plan by alleging that the company was never insolvent and should not have been placed in receivership. In affirming the District Court of Denver Judge Faris said:

> The rating base value furnishes no proper or legal criterion on which to bottom actual value. The former, according to the Supreme Court, is, as to physical elements, bottomed on present value of lands held, plus present stable cost of constructing the plant, less depreciation for use since construction, plus a fair allowance for going value, for intangible elements and for working capital. The latter, in a case like this, is bottomed on what a willing buyer, under no duress to buy, ought voluntarily to pay when the seller is forced to sell.
>
> The very definitions thus disclose the difference between such value and actual, or fair and reasonable, market value. The specific elements which enter into the actual value of a great railroad property as a going concern are: (a) The value of the use of such property in the operation of its railroad and the net revenue from such case, and (b) the current market value of its stocks and bonds.
>
> Obviously, the reference to the value of the stocks and bonds must be applied, in case of insolvency and reorganization, largely to the stocks and bonds of the new organization, and not to those of the old and insolvent one, because the latter would not reflect any earning value, but only exchange value under the plan of reorganization. But nevertheless these differences of constituent elements illustrate the fairly clear distinction existing between value for rate-making purposes and fair, market or actual value; and we think, show that the former does not necessarily bear any conclusive legal relation to the latter. Certainly this is so as to the matters herein up for judgment; whether it be so in all cases and situations we need not rule. Indeed, to take any other view of it would present a case of contradiction in terms.
>
> Practically speaking and in the light of human motives and experience, exchange or actual value of any commodity, except jewels, works of art, fungibles (articles destroyed by use), and the like, is bottomed on what a property will produce in earnings to the owner. But rate-making value is not and cannot be bottomed on earnings. If it were, or could be, it is plain that the more a railroad charged and earned, the more it would be entitled to charge and earn, and so, as has been said, there would arise an approximation of perpetual motion.

Interest on Chicago Bonds to Be Paid

The bondholders' protective committees of the Chicago City Railway and the Calumet & South Chicago Railway announced on May 20 that the interest due on the first mortgage 5 per cent bonds of both companies will be paid on Aug. 1. The principal of the bonds matured on Feb. 1 with the expiration of the franchise ordinances. A letter sent to bondholders says earnings are ample to pay interest obligations, and urges bondholders who have not yet deposited their bonds to do so at once in order that they may receive their interest promptly.

Readjustment at Grand Rapids Approved

At a special meeting on May 25 stockholders of the Grand Rapids Railway, Grand Rapids, Mich., approved a plan for readjusting the finances of the company in accordance with terms which have been reviewed previously in detail in the ELECTRIC RAILWAY JOURNAL.

Sale of St. Louis Property Postponed

The foreclosure sale of the United Railways, St. Louis, Mo., scheduled for May 25, was postponed at the request of Samuel Mitchell, solicitor for the Mercantile Trust Company, St. Louis, a plaintiff in the case by virtue of being trustee for an issue of bonds. William I. Igoe, special master, has not set the new date for the sale.

The reorganization committee plans to buy in the properties for the St. Louis Public Service Company, which is asking a 30-year service-at-cost franchise from the city.

The hearing on the application of Receiver Rolla Wells of the United Railways for a straight 8-cent fare has been continued by the Missouri Public Service Commission to permit counsel for the city to study transcripts of evidence offered by the company. The city has withheld its cross-examination.

Meanwhile the commission has been asked by Mayor Miller and Stanley Clarke, attorney for the reorganizers, to fix the rate of return the company should be permitted to earn under a service-at-cost franchise. This recommendation probably will be written into the new franchise before it is submitted to the voters of the city for ratification. Mayor Miller favors 6 per cent on a $60,000,000 valuation.

In his evidence in the rate case now under consideration Receiver Wells is asking for an 8 per cent return and has endeavored to build up a reproduction-new valuation of $101,233,616, and a present valuation of $75,454,073 for fixed property other than land. The going concern value of the properties was set at $8,700,000.

From "Banana Line" to Road of Service

Jamaica Central Railways Now Provides Adequate Facilities for 30,000 Persons Daily Under W. E. Ross

As a trolley the railway from Jamaica to Far Rockaway and from City Line to Belmont Park was long the community's standing joke. Just one year has changed not only the street railway system itself, but the public's mental attitude toward it. The official cognomen of the old line was the Long Island Electric Railway. Now the reorganized, revamped, repaired, reequipped, remanned and remade system is known officially as Jamaica Central Railways, Inc.

OFFICERS PROMINENT FOR ACCOMPLISHMENTS

Like most other similar enterprises, the Jamaica Central Railways, Inc., reflects the hopes and aspirations of the men at its head. It is officered chiefly by men who had made a mark in the world of finance, but whose experience in conducting an almost defunct railway was negligible. The president is H. Pushae Williams, president of the First Mortgage Guarantee Company of Long Island City and former president of the Queensboro Chamber of Commerce. The vice-president is Robert M. Catharine, Jamaica, one of the officers of the Bank of the Manhattan Company. In the treasurer's chair is Park A. Rowley, another prominent Jamaica banker, who is vice-president of the Bank of the Manhattan Company and in charge of all the Queens branches of this huge and important financial institution. H. L. Dayton, secretary, completes the official roster.

As their titles show, all are busy men. They give of their time to the railway only when matters of general policy are to be decided. The every-day affairs of the company they have intrusted to W. E. Ross, who has been general manager since March 15, this year, but was connected with the company previously and brought to the job a wide fund of experience. More about that later, for after all, accomplishments reflect the personalities of men and very often of one man in particular.

Now for these accomplishments. The Long Island Electric Railway became the Jamaica Central Railways, Inc., on April 6, 1926. The new corporation took over the property from a receiver. It consisted principally of the proverbial "two streaks of rust and a right-of-way." The cars were falling apart. The tracks were so badly worn that cars a dozen times a day left the rails. The concern had some ancient carhouses on New York Avenue, in the Cedar Manor section, but the principal building had never been rebuilt after a fire that practically destroyed it. Such machinery as there was for repairing and maintaining the cars and the roadbed was obsolete and of slight use. Several of the cars had been destroyed in the fire at the carhouse and the new owners found themselves the possessors of 25 ancient vehicles of the closed type and two of the open variety. Only the car crews knew when they were supposed to arrive at or leave any given point and the knowledge did not cause them undue anxiety, for usually it was impossible to adhere to any schedule, so dilapidated and untrustworthy were the cars and so unsafe the roadbed.

As quickly as possible, the new management placed six large cars in operation on the Far Rockaway line. Then ten one-man cars were added to the service. Two months ago six more closed cars were put in operation. As a result of the additional rolling stock, the headway has been materially shortened and now there is real service on the system's two lines, one between Jamaica and Far Rockaway and the other from Liberty Avenue and 100th Street, Ozone Park, to Belmont Park. That these two lines are vital to the public is revealed by the fact that 30,000 passengers ride upon them each day. This is an increase of more than 60 per cent over the amount of travel a year ago. Naturally the officers, and especially Mr. Ross, are justly proud of the fact that they can handle the increase and that so many persons find it advantageous to travel on the cars.

W. E. Ross

Twenty-two of the old cars taken over from the receiver have been repainted and put into first-class condition. All the obsolete machinery has been replaced and much new machinery added, so that the company is now able to keep its rolling stock in excellent condition at all times. A storage shed large enough to hold sixteen cars has been erected at Cedar Manor on the site of the one destroyed by fire. Into this shed every car is run at least once each week—every time it has traveled 1,000 miles—to be thoroughly inspected and, if necessary, repaired. Each car gets a daily cleaning and a weekly bath. All in all, 33 cars are in daily operation. Within a month there will be 37 on the daily schedule.

The officers of the company have gone further than merely to rebuild their cars, replace their trackage and wiring and machinery. They have created out of a haphazard nucleus of employees a band of earnest, hard-working men, with a realization that the public interest is their interest. For example, the company, at no cost to its employees, has provided each with a $1,000 insurance policy. To furnish a real incentive to good railroading, there is an annual prize of $500 to the employee with the best record. A bonus is paid monthly to motormen who have had no accidents on their runs. By this bonus system a careful motorman can add $100 to his year's wages. As a result, 52 of the motormen turned in reports for March showing not a mishap.

In all this work Mr. Ross has, of course, been at the front, aided and abetted by the encouragement of the directors of the company and the other officers. He went with the company in April, 1926. Previous to that time he was with the New York & Queens County Railway for nearly fourteen years. His last position with that company was engineer of way and structures under Lincoln C. Andrews. Mr. Ross was educated in the New York schools. The New York & Queens County position was his first job. He is 29 years old, but he has packed a lot of experience into these years. After all, for most of us life is estimated on the basis of accomplishments and not of years. On that basis does Mr. Ross stand revealed as a man of unusual resourcefulness.

◆

Key System Changes

W. R. Alberger and G. H. Harris Withdraw from Oakland Property—A. J. Lundberg a Director

Important changes are announced in the personnel of the Key System Transit Company of Oakland. W. R. Alberger, who has been connected with the company for the last 21 years, resigned as vice-president and George H. Harris resigned as general manager. It is understood Mr. Alberger will remain a member of the board.

Mr. Alberger has been succeeded by Alfred J. Lundberg, member of the San Francisco stock brokerage firm of J. Barth & Company, now the largest holder of Key stock. Until two years ago Mr. Alberger was vice-president and general manager, but was relieved of the duties of the last-named office, being succeeded by Mr. Harris.

The position of general manager, vacated by Mr. Harris, has been abolished, effective on June 1. Lester S. Ready, president of the company, will become operating head. Mr. Harris was promoted to the office of general manager from chief engineer.

In commenting on the changes, President Ready said:

> Following the election of Gustav Epstein and A. J. Lundberg as directors a few weeks ago, A. J. Lundberg has been chosen vice-president of the Key System Transit, succeeding W. R. Alberger, resigned.
>
> This is simply a recognition of the largest holders of Key System securities and brings to the service of the system several men of high standing who have a personal interest in the development of transportation in the East Bay district.
>
> Messrs. Epstein and Lundberg and H. E. Clayburgh, who has been on the board

since last November, are partners in the old established firm of J. Barth & Company, San Francisco, large holders of Key System securities. The partners in this firm intend to give of their time to the East Bay's transportation problem, the solution of which is as important to the people of the East Bay as to the owners of the Key System Transit Company. Both the people and the company are to be congratulated that men of standing will devote their time to reaching such solution.

Mr. Lundberg issued a statement in which he said:

Transportation is the backbone of every growing community. The Key System Transit Company is in the business of furnishing transportation to ten East Bay municipalities and two East Bay counties. The Key System is, therefore, the backbone of those ten municipalities and portions of these two counties. This is fully realized by my partners and me in taking positions as Key System directors. We believe in the East Bay and its growth and our primary idea will be to furnish adequate transportation of the right kind. Other plans will be secondary.

The Key System occupies the most important position in the East Bay, absolutely dominating local transportation and practically dominating transbay transportation. We do not intend to lose or jeopardize our dominating position. The Key System is fundamentally sound. It has ample physical assets. But there are many things that can be done in a spirit of co-operation between the people we serve and ourselves. We are ready to go much more than half way.

Our policy will be, first, a transportation system that will meet the needs of the wonderfully growing East Bay district. We in San Francisco are beginning to discover what you have in the East Bay. Millions of dollars of San Francisco money are being invested in Oakland and millions more will come if the same spirit of co-operation that has existed in the last few years continues. My partners and I have already invested large sums in Oakland and some of the directors of the Key System have been instrumental in bringing other millions to this side of the bay. I look for a wonderful growth, in which we hope to participate.

Retirement of Mr. Alberger and Mr. Harris means the withdrawal from active management of the East Bay's car lines and transbay ferry service of the last survivors of the F. M. Smith régime.

Further changes are anticipated, it being understood that the two announced are only the start of a thorough reorganization, including a change of policy. It is now declared that the new policy will not include the plans to unify the Key and the Southern Pacific ferry and rapid transit system. These plans had been mapped by engineers of both companies and were being studied by the respective managements.

In Memoriam

JUNE 1, 1926—JUNE 1, 1927

"We Live in Deeds, Not Words"

Since June 1, 1926, Death, The Inescapable, has taken its toll of those in our industry whose deeds live after them. At this season of memorial, the JOURNAL *is calling the roll, conscious that it will be answered by the thoughts of comrades who still march forward, guided by the unquenchable ideals these dead have bequeathed them.*

Eliseur S. Goodrich, former president Hartford Street Railway

J. D. Spreckels, president San Diego Electric Railway

John E. Duffy, general superintendent New York State Railways

Bert Weadon, traffic manager Interstate Public Service Company, Indianapolis

William S. Hamilton, supervisor of stores New York State Railways

George L. Fowler, consulting engineer

Charles A. Coffin, president General Electric Company

Herbert C. Moser, general manager Chicago Motor Coach Company

Franklin S. Terry, vice-president General Electric Company

Julius Thielson, superintendent Providence & Danielson Street Railway

Russell A. Wilson, assistant general manager Spokane United Railways

P. F. Sullivan, Bay State Street Railway

Clifford A. Elliott, cost engineer Pacific Electric Railway

C. R. Huntley, director International Railway and president of the Buffalo General Electric Company

J. E. Allison, head of James E. Allison & Company, Consulting Engineers

Robert Jemison, former president Birmingham Railway, Light & Power Company

A. D. McPherson, auditor Pittsburgh Railways

Alfred Craven, well-known engineer

Frank Cook, sales manager Ohio Brass Company, St. Louis district

Clermont Harvey Wilcox, president New York Insulated Wire Company

Anderson Gilbert Moore, industrial agent Interstate Public Service Company

Simon Bamberger, chairman of the board Bamberger Electric Railroad

Z. E. Knapp, director of construction London Underground Electric Railways

E. W. Bowman, supervisor of insurance Philadelphia Rapid Transit Company

Charles S. Butts, engineer in Department of Public Utilities for St. Louis

R. E. Breed, director American Light & Power Company

Adolphe Alfred Dion, president Moose Jaw Electric Railway

Paul E. Mercier, member Montreal Tramways Commission

Frederick M. Nellis, special representative at New York Westinghouse Air Brake Company

Frank M. Webster, claim adjuster Grand Rapids Railway

Virgil R. Powell, vice-president and general manager Peoples Railway, Dayton

Charles Edward Warren, long connected with New York Railways and Interborough Rapid Transit Company

W. H. Long, superintendent of power York Railways

Hugh A. Heulings, sales representative Brill Company

Col. William G. Dows, president Iowa Railway & Light Company

William B. McKinley, former head of Illinois Traction System

Henry J. Arnold, organizer of the Durango Street Railway

Frederick G. Orcutt, assistant paymaster Connecticut Company

E. M. Walker, president Schenectady Railway

William T. Fitch, superintendent maintenance of way Philadelphia Rapid Transit Company

Samuel M. Clement, former Public Service Commissioner of Pennsylvania

Alves Dixon, general manager Baton Rouge Electric Company

C. E. A. Carr, former Canadian electric railway official

M. H. Bronsdon, former chief engineer United Electric Railways, Providence

Clifton Colbrun, treasurer of Nahant & Lynn Street Railway

Anson W. Burchard, vice-chairman of board General Electric Company

Col. H. G. Prout, internationally known engineer and editor

William L. Schulz, formerly claim agent Washington, Baltimore & Annapolis Electric Railway

William Wright, auditor Washington, Baltimore & Annapolis Electric Railway

William H. Hodgins, secretary Okonite Company

O. C. Macy, vice-president Chicago, Harvard & Geneva Lake Railway

Albert Bath, executive of Detroit Department of Street Railways

Russell Robb, senior vice-president Stone & Webster

Lynn Shaddeau, purchasing agent Saginaw Transit Company

John S. Moore, general passenger and freight agent of Chicago, South Bend & Northern Indiana Railway

Charles Sidney Baxter, formerly with law department Boston Elevated Railway

Edward Carpenter Wood, president Mica Insulator Company

Edwin Samuel Ely, consulting engineer Virginia Electric & Power Company

Dudley Farrand, vice-president Public Service Corporation of New Jersey

George J. Baldwin, Stone & Webster

James W. Samuel, former assistant treasurer United Railways, St. Louis

Joe C. Thompson, secretary and assistant treasurer Texas Power & Light Company

Wallace Heckman, vice-president Chicago Railways

Oren Joseph Smith, one time chief engineer Denver Tramway

Joseph J. Heim, railway pioneer in Missouri and Kansas

Albert Ball, chief mechanical engineer Sullivan Machinery Company

Fred W. Reitz, president Evansville Traction Company

Jilson J. Coleman, vice-president and general manager Scranton Railway

Major S. L. Nelson, pioneer utility magnate in the Middle West

Albert M. Lynn, president West Penn Electric Company

William T. Nary, superintendent Berkshire Street Railway

Charles L. Henry, receiver Indianapolis & Cincinnati Traction Company

W. Kesley Schoepf, former head Cincinnati Traction Company

Marshall G. Linn, vice-president and general manager Des Moines Electric Light Company

G. E. Maltby, vice-president Jamestown Street Railway

Clyde F. Kalp, treasurer West Penn Railways

R. S. Maddock, superintendent of equipment United Electric Railways

H. E. Huntington, father of the Los Angeles local and interurban systems

Henry E. Huntington Dead

Romantic Career of Retired Railroad Director Ends in His Seventy-eighth Year—An Important Figure in California Utility Development—A Book Collector and Art Connoisseur

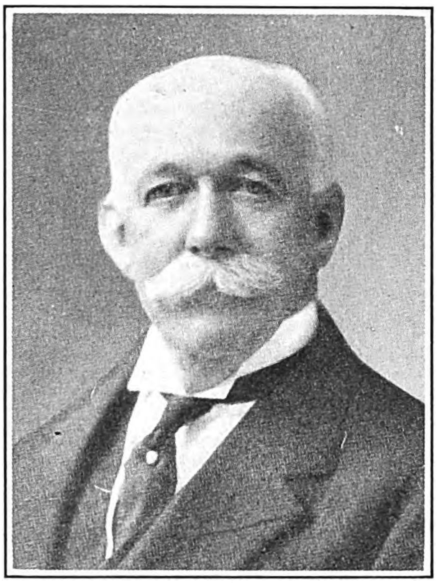
NOT all poets express themselves in words. This comment might serve as a fitting eulogy on the life of Henry E. Huntington, which terminated on May 23. The romantic and imaginative soul, nephew of Collis P. Huntington, among the first of the country's railroad men, found an outlet for his feelings in organizing and directing railroads, collecting rare books and works of art and in generously donating to philanthropic causes.

Not unlike the poet, the realization of profits alone was not the driving force back of his pioneering. True, he amassed a great fortune both for himself and his backers, but he was always peering beyond the horizon of personal profit, measuring his gain by the usefulness of his ventures. And the beneficiaries of his tireless energy, unfailing courage, unbounding resourcefulness and reliable judgment bear testimony to his transcendental vision. His genius for acquisition, minus the usual concomitant of avariciousness, is evidenced in his library and art collections, which upon his death are turned over to the public in perpetuity. In a beautiful building in San Marino, Cal., young and old, rich and poor, can view the famous Bridgewater library, renowned in England since the days of Queen Elizabeth and bought by Mr. Huntington in 1917. Competent authorities place the value of his art and rare books and manuscripts between $30,000,000 and $40,000,000, but Mr. Huntington did not count the cost. The hope of the man was that within the white stucco structure, finished in Italian style, inspiration could be had for the seeking.

Blazed the Western Trail

Surely Californians, and especially sons of Los Angeles, are both grateful and proud that Henry E. Huntington had a hand in the making of the West, for at the psychological hour in 1898 when the city of Los Angeles was cautiously courting prosperity along came the needed financier, who with foresight and courage projected a network of electric railways in the city which converted hamlets and villages into commercial and trading centers and made barren ground desired sites for homeseekers. Southern California, Henry E. Huntington and prosperity became a triumvirate the exploits of which will fill many pages of history.

As if by instinct he gradually gravitated to railroading. Though a descendant of railroad builders and a nephew of Collis P. Huntington, a pioneer of transcontinental railroad traffic, Henry E. at first showed little inclination for that calling. He left Oneonta, N. Y., where he was born on Feb. 27, 1850, and entered the hardware business. He was then twenty years old. Some years later he embarked in the lumber business in St. Albans, W. Va. Here, it is said, C. P. Huntington noted the ability of his young nephew and made him superintendent of construction of the Huntington line, then being built from Louisville to New Orleans. And so the career of the former hardware merchant began in earnest. He directed as many railroads as his promoter and backer had built. Some years later the elder Huntington made his protégé his chief aid and general representative in running the Central Pacific and Southern Pacific Railroads. As the years advanced the bond between the two men became closer, and when Collis P. Huntington died, in 1900, he left a large share of his millions to his nephew. That fortune and the one inherited by the uncle's widow were united in 1913 by the marriage of the widow to Henry E. Huntington.



Henry E. Huntington

It was after his uncle's death that the younger man turned to the West Coast, especially to developing projects in southern California. He acquired the Market Street Railway, San Francisco, selling the property in 1898 and buying the Los Angeles Railway. He merged a group of interurban railways into the Pacific Electric Railway, but sold that property to the Southern Pacific. It was in Southern California that he was convinced that he had located the field in which his capital might most profitably be employed. Los Angeles today is a thriving example of his judgment in that respect. The construction of the Pacific Electric Railway contributed greatly to the growth of Pasadena, Glendale, Alhambra, Huntington Beach, Alamitos and other important California centers. He added hundreds of miles of track to the system and spent more than $30,000,000 on improvements. The safety and comfort of the passengers were of no less importance to Mr. Huntington than the growth and development of the system. Meanwhile he interested himself in land developments, traffic problems, power development and all forces which might play an important part in the future of Los Angeles. Few men could read more accurately the signs of the times than Mr. Huntington.

Contemplative in Later Years

A review of the life of Henry E. Huntington discloses two periods of activity, distinct and defined. It was as if fate somehow had summoned him to fulfill two missions, the first to be concluded at about the age of 55 and the second with his death, at 77. In that first period he exhibited an uncanny capacity for physical activity and accomplishments only to be equaled by his desire for reflection and contemplation in the winter of his career. He was famous in his younger days as a director of railroads and in his older days as a pre-eminent collector of rare manuscripts and a connoisseur of works of art. His genius for acquisition was no less noteworthy, whether the object of his desire was a railroad or a Rubens, and the same characteristics which insured success in his early business ventures and won for him the reputation of pioneer and genius stamped him as a distinguished collector of books and works of art and intrenched him firmly in more than local affections. There is unmistakable evidence of the pride of the public in the certain endowments directly attributable to the railroading and rarity ventures of Henry L. Huntington.

Nicholas F. Niederlander, 80 years old, who was president of the Westinghouse Coupler Company until about fifteen years ago, when he retired, died in St. Louis, Mo., on May 20. He was president of the Westinghouse company for ten years prior to the time he retired.

John H. Slough, for 23 years a general claim agent for the United Railways, St. Louis, Mo., died at his home in Overland, St. Louis County, Mo., on May 13. He retired from active field service four years ago, but since then had been on special assignment in the office of the claim department of the company. He ranked as an assistant claim agent. Mr. Slough was 70 years old.

William E. Holstock, superintendent of transportation on the Syracuse lines of the New York State Railways, died on May 5. He had charge of all employment, discharges and discipline. At a very early age Mr. Holstock took a position with the Saginaw Street Railway, where he received experience in railroading both as a conductor and a driver of horse cars. In 1887 he went to Syracuse and entered the employ of the People's Railroad, where he soon was advanced to the position of carhouse foreman. In this position he had charge of 400 horses housed at the carhouse and his duties included the buying, selling and trading of horses. When the Syracuse lines were electrified Mr. Holstock was made station master at the Wolf Street station. On April 16, 1906, he was appointed general foreman. He next advanced to superintendent. Mr. Holstock was born on June 14, 1859.

Manufactures and the Markets

News of and for Manufacturers—Market and Trade Conditions
A Department Open to Railways and Manufacturers
for Discussion of Manufacturing and Sales Matters

Large Coal Stock Nullifies Strike Menace

The Bureau of Mines stock report raises the curtain on the stage which was set April 1. It confirms in full the impression that had been created by heavy production that stocks are enormously large. They are so large that, strike or no strike, they will dominate the market for months to come.

Stocks of bituminous coal in the hands of consumers totaled 75,000,000 tons. This is 12,000,000 tons in excess of the previous record, established on Armistice Day at the close of the fuel administration's campaign for emergency storage. It is 13,000,000 tons greater than the reserve built up at the beginning of 1924, when consumers foresaw the possibility of a strike which was avoided by the Jacksonville agreement. It is from 12,000,000 to 15,000,000 tons greater than the reserve at the beginning of the strike of 1922. Besides the coal in the hands of consumers there was a very large reserve in transit.

The record shows that consumers have refused to take chances, despite the practical certainty that production would continue at the rate of 8,000,000 tons or 9,000,000 tons a week, as against only 3,000,000 tons or 4,000,000 tons in 1922. They laid in a reserve 20 per cent greater than that which they built up in 1922. The railroads alone have 22,800,000 tons of coal on hand.

With this unusual amount of coal above ground it is regarded as a complete explanation as to why the market has been so dull since the suspension began. At least 40,000,000 tons of the surplus will have to be absorbed before the market will be in a usual state of balance as between buyer and seller. Had there been no suspension it is doubtful if current production would have been any larger. A long period of low weekly tonnages appears inevitable.

Under the circumstances the suspension must last a long time before it can change the market and offer any hope of profit to the hard-pressed union operator. On the other hand, an immediate settlement still would leave the industry faced with the problem of absorbing an undigested surplus of 40,000,000 tons.

Track Reconstruction Under Way in Springfield, Mass.

The Springfield Street Railway, Springfield, Mass., has started work on the first lap of its reconstruction program. Trackwork on Sumner Avenue is to be started at once and the work of tearing up the old trackwork is already under way. The entire project between White Street and the X will be completed in about three weeks. This will be followed by relaying the tracks on Belmont Avenue from the X to the East Longmeadow line. Tracks are also to be relayed on State Street from Benton Street to Pine Point. In order to expedite the transportation of passengers Herbert M. Flanders, general manager, plans to use buses to transfer passengers.

Ban Put on Noisy Exhibits at A.E.R.A. Meeting

In connection with the exhibit application blanks recently mailed out by Fred C. J. Dell, director of exhibits of the American Electric Railway Association, attention is being called to the committee's ruling on noisy exhibits. The ruling especially applies to the Esplanade, Section E, and Exhibition Hall, Section B, where the following restriction will obtain:

"Noisy exhibits will not be permitted to operate during convention sessions except in prescribed areas. Under no circumstances will the operation of noisy exhibits be permitted in the proximity of meeting rooms." Exhibitors are asked to co-operate.

Capitalism and Communism at Grips in Geneva

Russian Delegate Rakes Capitalist System and Suggests Transitional Plan of Eleven Steps for Renewal of Trade—Unanimity on Nations' Interdependence

By Edward J. Mehren

Vice-President McGraw-Hill Publishing Company

GENEVA, May 9.

THE plenary sessions of the International Economic Conference are over for the present and the committees on commerce, industry and agriculture get under way this morning. The closing plenary sessions rivaled in interest the earlier ones, for they included the speeches most eagerly awaited—those by Henry M. Robinson, head of the American delegation; by the Russian delegates Sokolnikoff and Obolenski-Ossinski; by W. T. Layton, editor of the *Economist* and member of the British delegation, and by Monsieur Loucheur of France.

Robinson Speaks for America

What would be America's view of the various proposals, was the constant query of the first two days, and when it came none could want a clearer statement than Mr. Robinson's. The American believed that the actual level of tariffs are less of a barrier to trade than lack of stabilization of tariffs, abrupt changes in duties, lack of definiteness in classification and terminology. In maturing methods for mitigating those difficulties the conference might help.

The American delegation, he indicated, would not oppose the international cartel idea as such, but would disapprove government participation in them and insist that they must not exploit the consumer. He sketched briefly and clearly the development of the American industrial system and accounted for our present prosperity by improvements made in management practice, by elimination of waste, by lavish use of machinery and full interchange of information on production and trade methods. He indicated that the tendency of management now was to secure needed economies by bettering its practice, eliminating waste and introducing more and better machinery rather than by wage reduction.

Mr. Robinson, I said, was calm and gracious, but while continuing so he showed that there was fighting reserve, if need be. Sir Max Muspratt, Great Britain, had said that there was no discrimination against America in the rubber exportation restriction, since all nations were treated alike. Mr. Robinson remarked that he could not follow the argument when a non-producing country (America) took 75 per cent of the production, while the country which controlled the restrictions consumed only 7 per cent of the supply.

The speech was well received, and comment on it indicated again the opinion in Europe that we are the darling of the Gods. They are trying to grasp our secret, they doubt that the methods are applicable here, but they vaguely realize that in some way they have to grow into an industrial practice approximating ours.

Russia Speaks

But if Mr. Robinson received close attention, the interest was intensified when Sokolnikoff arose. Delegates massed solidly around the tribune to catch every word. What would a new social order say to the old? What message did the Union of Soviet Republics have for the capitalistic world?

But there was disappointment. There was only one message for the capitalistic world: "Come and trade with Russia. We welcome foreign capital. The capitalistic and communistic social systems are different, but they can work together."

The remainder of the address was a defence of the communistic order and the painting of a laudatory picture of Russian progress. He admitted that agricultural and industrial production were above pre-war figures, called into question later by Loucheur and mistrusted generally here. There was no favoritism to any group in the community.

Sokolnikoff having failed to reach expectations, rumor soon had it that his colleague, Obolenski-Ossinski, head of the delegation, would fire the hot shot. And he did. He raked the capitalist system fore and aft, accused it of anomalies, of causing the World War, of impotence to handle the economic situation effectively. Even the most ardent apostle of "capitalism rampant" had to admit that some of his criticism caught chinks in the armor of capitalistic states, though he failed to carry conviction that communism's armor was free from flaws, or that the communistic system had handled or could handle the present economic situation more effectively.

As a transitional plan he suggested eleven steps for the re-establishment of trade:

1. Cancellation of war debts.
2. Increase of wages of industrial workers.
3. Introduction of the eight-hour day for all workers, with six hours in mines and "similar industries."
4. Fullest liberty for trade union organizations and complete liberty for strikes.
5. "Real" measures for relief of unemployed.
6. Raising of unemployed relief funds by taxation.
7. Decrease of unproductive expenditure, particularly in armaments.
8. Abolition of all barriers against emigration and immigration.
9. Cancellation of all systems of protectorates and mandates and recognition of rights of all peoples to self-determination.
10. Suspension of all measures of intervention in China.
11. Suspension of all measures of economic boycott against Russia and re-establishment of relations with her so that she can obtain credit needed for her development, the capitalists in turn securing concessions.

Undoubtedly his speech and that of his colleague were so eagerly awaited because it is appreciated here that a Russia opened for full trade would be an important factor in European trade and industrial recovery.

LAYTON'S SEARCHING EFFORT

An outstanding effort was that of Mr. Layton and the audience was quick to respond to his searching analysis and clear and convincing exposition. He pointed out that despite the recovery of European production in 1925 to 104 per cent of pre-war and trade to 94 per cent there were 10,000,000 men out of work. But it was false, he maintained, to strive to return to the pre-war status. A new status, a "new equilibrium," is needed, due to the following new conditions:

1. The great increase in industrialization in all countries—a continuation of tendencies visible before the war but much accelerated by the conflict.
2. The development of the United States into a creditor nation, but under conditions different than that of previous capital exporting nations, for while Great Britain, for example, as an exporter of capital, had had a surplus of imports, buying goods from countries she financed, the United States was taking steps to keep out the products of countries she was helping to develop or restore.
3. Alteration in emigration.
4. Alteration of trading relations, due to settlement of reparations and international indebtedness arising out of the war. Debtors had to develop an export surplus and creditors to accept an import surplus.
5. The large shrinkage in Russian trade.
6. Division of central Europe into small economic and political units. New tariff walls to the length of 11,000 km. have been erected, there has been a large waste of capital through duplication of plant as between these countries and a reduction in volume of trade between the fractions of the old Austro-Hungarian Empire and between them and contiguous countries, making necessary difficult trade divisions and adaptations.

More Than 100%

52 Applications totaling requests for 27,296 sq.ft. of space

against

1926

25 Applications for 10,363 sq.ft. for the same period.

Let's Go

The splitting up and duplication of plant run counter to the sound tendency toward consolidation and specialization which have brought such prosperity to the world. Small economic units, he remarked, were an anachronism.

He declared that plans to meet the new conditions must be based on these fundamental, but very simple principles:

1. The interdependence of the nations of Europe is so close that their economic prosperity must rise or fall as a whole; no nation in the long run can be prosperous through its neighbors' misfortunes.
2. Material well-being can only be achieved by economic production; permanent prosperity will never be achieved within by industries or by communities which pursue a policy of trying to make profits by restricting production.
3. Europe can keep abreast of industrial progress only if her economic organization permits of specialization, not merely between businesses but between nations. This requires substantial reductions in existing tariffs, so that the tide of international trade may flow in greatly increased volume.

He favored development of an organization for continued collaboration of these economic problems.

UNANIMITY ON NATIONS' INTERDEPENDENCE

The summaries of these addresses of these first four days indicate generally the consensus of opinion of the delegates and foreshadow the conclusions that may reasonably be expected in the ultimate resolutions. Surely the world will not lack now for an understanding of its economic difficulties.

Chief unanimity is found in the thesis of the interdependence of nations, particularly of those in Europe. At the same time nationalism asserts itself, the small nations, for example, demanding that they be not exploited by international combines of the greater nations, and Italy giving notice that if her people cannot emigrate she will have to set up tariffs to develop new industries for keeping her people employed.

Second in order is agreement that tariffs must be stable and that customs, nomenclature and classification must be simplified and standardized. Theoretical statements are common to the effect that tariffs must be lowered, but one detects reservations and hedging. But such reduction would seem a logical tendency after the easier remedies had been applied and had been operative for a number of years.

On the third most important point, the advisability of international industrial combines, selling agreements, etc., covered by the term cartels, there is hardly unanimity. In general they are accepted as a sound and logical international development rising out of international industrial consolidation. But there are reservations of many kinds. The Americans will disapprove if governments are participants in these international combines if they are exploitive. The socialist and Christian labor unions and Loucheur demand some sort of control mechanism to prevent exploitation of workers and consumers, Loucheur's scheme being a bureau of information, observation and publicity. The non-industrial nations fear exploitation by the industrial powers working in concert. Italy fears their effect in the crystallization of industry, due to a lack of competition, and emphasizes the harmfulness of such crystallization to the nations which "have not yet completed their economic industrial growth."

So while agreements may be looked for on removal of trade barriers, action on international cartels is problematical. Another week will tell the tale.

Experts Will Probe Sales Below Cost

The economic effects upon prosperity of taking business below the cost of manufacture will be studied from all angles at the eighth International Cost Conference, which opens in Chicago on June 13.

About 1,000 accounting executives, who gather the data on which industrial and trade operations are based, will attend the conference. The association has 3,200 industrial companies, including the largest in the country, in its membership of more than 4,000. Each of the 30 chapters will send delegates. C. M. Finney, vice-president of the Worthington Pump & Machinery Corporation, is president.

Key System Will Spend $50,000 for Safety Signals

Lester S. Ready, president of the Key System Transit Company, Oakland, Cal., has announced the immediate expenditure of more than $50,000 in the erection of safety signal devices.

Approved by the California Railroad Commission, the safety device being installed by the Key System is the result of research on the part of H. P. Bell, chief engineer of the Key System Transit Company.

The signals are being installed at all the important crossings and the first one was completed April 19 at 40th Street and Telegraph Avenue, Hayward, Cal.

Many Orders for Mack Buses from Electric Railways

Many orders are reported by the International Motor Company, New York, N. Y., from electric railways operating in various parts of the country:

The New England Transportation Company, bus operating subsidiary of the New York, New Haven & Hartford Railroad, has ordered twelve Mack bus chassis, 230-in. wheelbase, four-cylinder motor. Brown Body is building the bodies.

The Iowa Southern Utilities Company, Burlington, Iowa, has purchased four 25-passenger Mack city type buses, 196-in. wheelbase, four-cylinder motor for city service in Burlington.

The Blue Goose Motor Coach Company, Inc., bus operating subsidiary of the East St. Louis & Suburban Railway, East St. Louis, Ill., has purchased three 29-passenger Mack city type buses, 233-in. wheelbase, six-cylinder motor, for suburban operation.

The New York, Westchester & Boston Railway, a traction subsidiary of the New York, New Haven & Hartford Railroad and operating the bus company, County Transportation Company, has ordered twenty more 29-passenger city type Mack buses for operation in Portchester, N. Y. and vicinity. This order is in addition to the five delivered recently.

Six 25-passenger city type Mack buses, 196-in. wheelbase, four-cylinder motor, have been purchased by the Union Transportation Company, bus operating subsidiary of the Oklahoma Union Railway, Tulsa, Okla.

This does not exhaust the list. It is merely typical of some of the outstanding purchases.

Northern Pacific Buys Gasoline Cars

Northern Pacific Railway, Walla Walla, Wash., has ordered three new gasoline-electric cars capable of pulling coaches, according to F. E. Williamson, vice-president in charge of operations. One of the cars will be installed on a run between Seattle and Bellingham and will be a combination coach, while the two others are to carry baggage and mail, pulling passenger coaches as trailers, in North Dakota, also between Staples, Minn., and Oakes, N. D. The new equipment will cost $130,000.

Copper at Lower Prices—Lead Also Down

THE general feeling in the non-ferrous metal market this week is not one of optimism, as silver is the only metal that has given a good account of itself, the price of 57 cents per ounce on May 25 being the highest since April 11, says *Engineering and Mining Journal*. Copper prices have been driven down close to 12½ cents by forced selling; a fair amount of business was secured, but the total was well below average. Lead prices have declined further, but most sellers have found a satisfactory market in other respects. Zinc has refused to break through 6 cents, but cannot be said to be particularly firm. There is little change in tin or the minor metals, though platinum sagged a little further.

The decline below the 15-cent, delivered, level for copper, which began a little over a week ago, gained momentum during the week ended May 25. Some sellers have consistently kept out of the market, but no one seller can be accused of the entire responsibility for the slashing of prices. On Thursday, May 19, there was little doing, but on the next day copper sold all the way from 12⅞ cents, delivered Connecticut, which was the general level early in the morning, down to 12⅝ cents, which was all some anxious sellers could get late in the afternoon. Since then the market has been generally 12⅝ cents in the East, where most of the business has been done. On May 25, however, copper was offered as low as 12½ cents.

Indications are that good buying would appear at 12½ cents, though the recent sharp decline has scared buyers, and has also had a bad effect, so it is said, on brass and wire business.

Little change has occurred in the zinc market this week, both the prices and the volume of sales being about the same as a week ago. Most of the zinc sold has been for May or June shipment and has been booked at 6.05 cents, though as high as 6.10 cents has been paid for a small quantity of July metal that was not sold to a consumer. London has declined each of the last four days, which weakened the market here slightly on Wednesday. Spot carloads of high-grade continue to be offered at 8 cents, delivered.

In the aggregate a fair volume of lead changed hands in the domestic markets during the week ended May 25, although business was unusually dull for one or two sellers. The preponderance of sales were for delivery in the Eastern territory, though much of this was for shipment from St. Louis. The American Smelting & Refining Company reduced its official contract price from 6.65 cents to 6.50 cents on Thursday, May 19, and very little cutting of this price was reported during the week. The price range in the St. Louis market has been wide. The leading interest, until May 25, quoted 6.20 cents, and until the preceding day made sales at that figure. On the other hand 6.125 cents was done on a fair tonnage as early as Friday, May 20. Sales of small tonnages at 6.15 cents and 6.175 cents were also reported; and several sales were made in Chicago at 6.175 cents. The domestic price continues at levels low enough to exclude Mexican ore lead in spite of some decline, especially in futures, in the London market.

Tin prices were slightly higher May 25 than they were a week ago, the improvement of 99 per cent grade being more important. Straits is scarce for prompt delivery, whereas the lower grade metal is available in moderate quantity, which accounts for the unusually wide spread between the two. Buying by consumers has not been important, but speculators and dealers have done a fair amount of trading.

METAL, COAL AND MATERIAL PRICES
F. O. B. REFINING

Metals—New York	May 24, 1927
Copper, electrolytic, cents per lb	12.625
Copper wire, cents per lb	15.125
Lead, cents per lb	6.485
Zinc, cents per lb	6.40
Tin, Straits, cents per lb	67.875
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$4.425
Somerset mine run, Boston, net tons	1.875
Pittsburgh mine run, Pittsburgh, net tons	2.10
Franklin, Ill., screenings, Chicago, net tons	†
Central, Ill., screenings, Chicago, net tons	†
Kansas screenings, Kansas City, net tons	2.50
Quotations withdrawn because of strike.	
Materials	
Rubber-covered wire, N. Y., No. 14, per 1,000 ft.	$5.15–5.20
Weatherproof wire base, N. Y., cents per lb.	16.75
Cement, Chicago net prices, without bags	2.05
Linseed oil (5-bbl. lots), N. Y., cents per lb.	11.50
White lead in oil (100-lb. keg), N. Y., cents per lb	14.50
Turpentine (bbl. lots), N. Y., per gal	$0.63

Estimates place the world's visible supply at the end of May at about 1,000 tons above the corresponding figure for April 30, an increase in shipments from Banka being the principal factor in enlarging the supply.

Rolling Stock

East St. Louis Railway Company, St. Louis, Mo., is reported as having ordered, early this month, six new cars. This company placed in service six completely rebuilt cars on May 11.

Street Railway Properties, Phoenix, Ariz., shortly will purchase a number of one-man, pay-as-you-enter cars due to the passage of a $750,000 bond issue by the municipal authorities on April 30, referred to recently in the Electric Railway Journal. According to law 30 days must elapse before the bonds are marketable.

Track and Line

Kansas City Public Service Company, Kansas City, Mo., is about to lay track on Main Street from Third to Ninth Street and on Grand Avenue from 22d to 24th Street. The new work will increase the total amount of trackage laid since the dismissal of the receivership last October to 8 miles.

Saginaw Transit Company, Saginaw, Mich., has embarked on a general program of track rehabilitation. Work at present is centered on South Michigan Avenue. near the Michigan Central crossing. After completing this the crews will tackle the following jobs: East Genesee from Warren Avenue to Hartsuff Street, Court Street, Warren Avenue, Sixth Street and Wadsworth. Aside from the general track repairing, the company is co-operating with the railroads that are crossed in repairing, raising and paving the crossings.

Trade Notes

The Dayton Manufacturing Company, Dayton, Ohio, announces the opening of a New York Office at 918 Havemeyer Building, Church Street. This office will be in charge of Joseph Leidenger, vice-president.

The White Company, Cleveland, Ohio, has devoted issue No. 73 of its house organ, the *Albatross*, to a novel presentation of the White cars that bind motor transportation with nationally advertised products. The magazine is profusely illustrated and includes pictures of the trucks of 57 companies that own more than 9,000 White trucks and buses.

New Advertising Literature

The National Machinery Company, Tiffin, Ohio, has placed in the mails "National Forging Machine Talk No. 61."

Ohio Brass Company, Mansfield, Ohio, is mailing out a new valve folder describing its O-B line of standard globe valves.

Electric Railway Journal

Consolidation of Street Railway Journal and Electric Railway Review

CHARLES GORDON, *Editor*

Volume 69 New York, Saturday, June 4, 1927 *Number* 23

Comfortable Seats Increase Car Earnings

FARE box receipts are of necessity the acid test of policy on an electric railway property. But it is often difficult to calculate exactly the financial effect of any particular innovation. Determination of the dollars and cents value of comfort and attractiveness in car design is an instance of this kind. Every one knows in a general way that passengers prefer attractive cars and comfortable seats. How strong is this preference? Before spending money on rolling stock improvement, the prudent manager wants to know that he will get back a fair return on his investment.

Recently twelve of the newest cars on a large electric railway in an Eastern city were reconditioned, equipped with leather bucket seats and linoleum floor covering and repainted outside in a different color. During the day these cars furnish about half of the service on the line where they are operated, and during rush hours about one-quarter of the service. Revenue per car-hour for the entire line averages approximately $4.75, while that for the new cars alone is approximately $5.50. Thus the improved cars are earning 75 cents per hour more than the general average, and about a dollar an hour more than the older cars. It is significant that the revenue of the comfortable cars is above normal for that particular line, while that of the others remains about the same as it has been for some time past. The difference in revenue therefore represents a definite traffic increase due to the improvement.

The foregoing instance is unusual only in that the relation between cause and effect is so clearly discernible. Advance calculations of this relationship are difficult, if not impossible, but the electric railway industry now has had enough experience with attractive cars to convince the doubtful that money spent in rolling stock improvement is a dividend-paying investment.

Are Convention Exhibits Worth the Costs?

AT A GATHERING of street railway men that assumes the magnitude of the annual convention of the American Electric Railway Association, the necessity for exhibits is so obvious that it would hardly need stressing, were it not that there are some manufacturers who still believe an intricate piece of mechanism can be promoted adequately in the abstract by means of a high-powered sales talk. The majority of us want to see and to examine. We want, if you please, an outward visible sign that the machine or appliance can actually perform what its builder claims. Further, we want to discuss the merits of this or that mechanism with our co-workers, whose opinions we respect. And last, but not least, we want to take back to our superior officers something besides speeches and resolutions.

Convincing arguments in favor of exhibits are found in a short review of the attendance records at the exhibits and exhibitless conventions of the association. Excluding the years 1917 and 1918, when the war prevented any exhibits, the records stand as follows:

Year	Convention City	Registration	Manufacturer Company Members	Number of Exhibitors	Total Space Sold, Sq.Ft.
1916	Atlantic City	3,271	208	125	57,329
1919	Atlantic City	3,166	206	157	62,219
1920	Atlantic City	3,300	200	136	59,529
1921	Atlantic City	1,189	225	No exhibit	No exhibit
1922	Chicago	4,200	244	141	61,895
1923	Atlantic City	4,404	274	162	75,681
1924	Atlantic City	5,804	330	192	86,349
1925	Atlantic City	7,147	371	204	100,030
1926	Cleveland	8,623	423	271	119,007

Is this not reason enough for asking: Is the exhibit worth its cost to the manufacturer? Take the tabulation for 1920, when there were 3,300 registrations with 136 exhibitors and 50,529 sq.ft. of space sold. Compare this with 1921, when, through fear of the financial depression, no exhibit was held. Look at the convention registration and then glance at these same figures for 1922. Thus there is ample justification for bigger and better exhibits.

Radio Interference Complaints Are Annoying, but Result in Better Maintenance

CAUSES and remedies for radio interference brought out lively discussion at a meeting of the New England Street Railway Club held in Boston on May 12, as told in this paper last week. It was generally agreed by those present that this added responsibility must be assumed by the electric railways and that most of them now are making every possible effort to eliminate causes of radio interference.

Although the receipt of numerous complaints from residents along electric railway lines is annoying to the electric railway officials, the correction of the troubles, after the real reason for the disturbance has been found, affords an excellent chance for the railway to build good will among its patrons. Where some part of the railway equipment is at fault, location of the cause of radio interference results in a higher grade of maintenance and in some cases avoids troubles which eventually would prove serious.

Experience of those who discussed the subject of causes for radio interference at Boston shows that the interruption of small currents is the most disturbing factor. The greatest amount of interference to radio reception appears to be caused by currents of such small intensity that their interruption causes sparks rather than arcs. Interference from the ordinary heavy current flows over wires and tracks, if the circuits are in good condition, should be negligible.

Disruptive discharges which may be termed accidental are very hard to trace. These include many types of leaks or grounds which are increased by atmospheric or wind conditions. Such arcing is usually intermittent and may be caused by tree grounds or the swinging and vibration of overhead lines. Interference which comes from arcing of motors, trolley wheels, broken bonds, defective contacts in automatic electric track systems, signals and the like lead to investigations and remedies which ultimately prove of advantage to the electric railway.

It appears that the tendency of radio listeners has been toward the use of more sensitive sets, and many have tried to increase the distance at which they can hear programs over their sets by using some form of "superhet," either factory made or of home construction. In many cases such attempts have resulted in an increased amount of noise and interference and the listeners have directed their attention to causes which appeal most naturally to them. That is, to the operating electric railway company in their vicinity.

Many railways now have specially organized departments where complaints are received, and where experienced men investigate the causes, then analyze and tabulate these for future use. The signal department of the United Electric Railways, Providence, R. I., now has this work on an organized basis. Complaints are received by letter, telephone, and through the radio department of other local utilities. Data obtained are put on a regular radio form. A number is assigned and the form is then forwarded to an inspector in charge of this department. Complaints are taken up in order and every method is used to locate and clear up the trouble. Out of 76 radio complaints investigated it was found that 40 per cent were due to leaking insulators and bare feed wires in trees, 25 per cent to leaking caps and cones, 20 per cent to trolley pick-up, 5 per cent to local lighting companies, and 10 per cent to owners' sets. It thus appears that interference caused by some defect on the company's system can be remedied without difficulty.

Buffalo Should Help, Not Hinder, Its Railway

REPORT has it that the Public Service Commission is about to use its good offices in an effort to effect an amicable settlement of the matters that have long been at issue between the city of Buffalo and the International Railway. This is indeed good news. It is perhaps true that the railway has not been without blame for the situation there, but its sins of omission and commission must at least be considered in the light of the uncompromising attitude of political forces which have been in control in Buffalo.

It has been necessary for the company at times to fight, and fight hard, but this attitude seems in large part, at least, to have been forced upon it by the city administration, aided and abetted by some of the local newspapers. The situation is best instanced by criticisms directed against the company by one of the local commentators for its stand with respect to increased fares, its insistence on the right to run one-man cars, and its opposition to making street improvements considered to be unduly burdensome.

There is nothing wrong *per se* in an application for an increase in fares. Perhaps the company has hewn too closely to the line of its rights and has not done all that is possible to win public interest in its needs. But the fare matter is an issue that ought to lend itself to settlement on the basis of the economic and financial factors that govern. As for the reference to the one-man cars, it is unfortunate for the critic to designate that vehicle as unpopular. The stand of the opponents of the railway rather than that of the railway itself is arbitrary on this matter, for the International is by no means alone in its advocacy of one-man operation. Hundreds of other companies have found it not only expedient, but a successful method of providing satisfactory transportation at minimum cost. In the matter of street improvement, which apparently involves the question of paving, the city of Buffalo should recognize that the tendency as indicated in five states and more than 60 cities has been more and more to apply car fares toward improved transportation service and not to paving city streets.

As indicated before, the company has perhaps not been altogether without blame, but its attitude with respect to the matters just reviewed and its indisposition calmly to sit by and contemplate the entrance of competition are not without justification from the standpoint of self-preservation, and also on the score that the things it seeks have led to the best results elsewhere, not only for the railway but for the community and its citizens. It is to be hoped that the practice of resorting to corporation baiting tactics in Buffalo is at an end, and that the company thus may soon be put on its mettle under circumstances and conditions that will permit it to function properly.

What One Industrial Operator Thinks About Transportation

USE of automobiles by industrial workers has been the subject of frequent discussion. Recently an industrial operator was commenting on this problem and in general decried the additional expense which factory workers were thus assuming, as being an unfortunate condition not to the liking of the management.

However, he saw a possible excuse in the local situation. This was the unsatisfactory service given by the street railway passing the factory. He said that the cars lacked the comfort, speed and general attractiveness to which the industrial worker as well as the balance of the riding public had been educated. When questioned further it appeared that the service and equipment offered was neither better nor worse than it had been for the past decade or more, but relatively it was far inferior to the present day conception of modern transportation.

Observation of the street railway system readily revealed the fact that it was about on a par with many other properties. The same kind of cars were in use on the same kind of track, maintained to about the same condition that prevails in three-quarters of the properties throughout the country. The same loading standards also were used and the cars upon arrival at the plant and when leaving at night had standing passengers whether ten cars or 30 were needed to provide the "service." Occasional complaints of overcrowding, lateness or bad ventilation were made, often to the industrial management, which in turn entered complaint to the car company. The impression was created that such complaints were only partially adjusted. The whole situation was summed up by the remark by this industrial operator that "If we attempted to run our business and offer as little service as the street railway we would be out of business in three months."

These remarks are a reflection not only against this particular railway but also to some extent against the whole industry. Often it has failed to recognize or respond to this general condition. True there has been serious financial embarrassment with which to contend, but the fact still remains that a large portion of operations are stabilized today. This same large portion is offering standardized service today as it was twenty years ago—but standard to what? Certainly not to conditions to-day. The industry is serving a new public. Just as the youth of today are fearlessly setting new standards of living that make the older generation often stand aghast, just so have the demands changed in transportation. If the people of today are to be sold, common carrier service must be produced on today's specification.

Worthy Prizes Encourage Valuable Suggestions

IN THE present era of prize awards can be heard a voice of the Roman past, "Give, I pray, rewards worthy of my ability." In answer thousands of dollars are awarded for artistic furniture designs, realistic short stories and convincing advertising slogans and posters. Nor have the utilities taken minor rôles in this movement. Prizes totaling $300 will be awarded every 60 days throughout the year by the Chicago, South Shore & South Bend Railroad for the successful efforts of employees in obtaining new business for the company. Another example is on the Chicago, North Shore & Milwaukee Railroad, where prizes ranging from $10 to $250 were awarded to 76 employees for securing new passenger and freight business. In Saginaw, Mich., citizens were recently awarded prizes by the utility there for the best essays on "The Value of Street Car and Bus Service." Again, in Buffalo the International Railway offered gold prizes in a competition for high school art students. It is expected that many of the designs submitted will be used in the cars of the system within the next few months. The Georgia Power Company has given prizes to its railway employees for essays on "What service do we owe the passenger for his fare?"

So the old order changeth. In the past, speaking broadly, prizes have been offered most frequently in safety contests. Now the employee is encouraged to use his imagination as well as his hands. May the prize contests fostered by the railway companies continue, with the managements amenable to honest suggestions and the patron and employee responsive to rare opportunities. Moreover, let the winners have prizes worthy of their ability.

Increasing Toll Among Street Workers

EMPHASIS is well directed that is placed on the hazards that attach to men engaged in work done by the electric railways in the streets. It is of course true, as a correspondent of the JOURNAL points out, that the subject has been touched upon many times in association work, but the problem seems to be how best to proceed to bring the matter to the attention of the public authorities and how to punish offenders who ignore barriers. Record could be piled upon record to show the seriousness of this matter, but the case of the Denver Tramway is typical of the experience of other companies. In that city, between February, 1923, and March 16, 1927, inclusive, seventeen men of the company were seriously injured, two of whom died as a result of being struck by automobiles while engaged in trackwork in the streets. Think of it! Really some of the instances of recklessness on the part of motorists that have been cited by representatives of various companies stagger one at the heedlessness of the average driver.

Men must on occasion work in the streets. There is no getting away from that. The devices which the companies have adopted for protection appear well nigh to have exhausted human ingenuity, but they are apparently of little avail. There is no need to cite them, but it is not amiss to say that frequently three or four men are employed to protect a similar number while at work, all because the average motorist is so heedless.

The problem is not alone that of the track department. It is the problem of every man connected with an electric railway anywhere. The managements are almost at their wits' ends over the matter, and any man anywhere who can advance a suggestion that will materially reduce the hazard to employees engaged in street work will do his fellow employee and humanity a real service.

It is, of course, important that adequate punishment be meted out to the driver who handles his machine recklessly, but that is second to the matter of devising preventive measures more efficacious than any that have yet been devised. Punishment after the offense, however, will not restore to usefulness a man who has been seriously injured, nor will it restore life to one who has been killed. As the JOURNAL has pointed out before, there is apparently no complete answer to the question, but the more the problem and its solution are discussed the more likely it is that the hazard will be diminished. The matter is, of course, complicated by the increasing multiplicity of machines and by the fact that more and more does the automobile come into the hands of the reckless, the incompetent and the financially irresponsible.

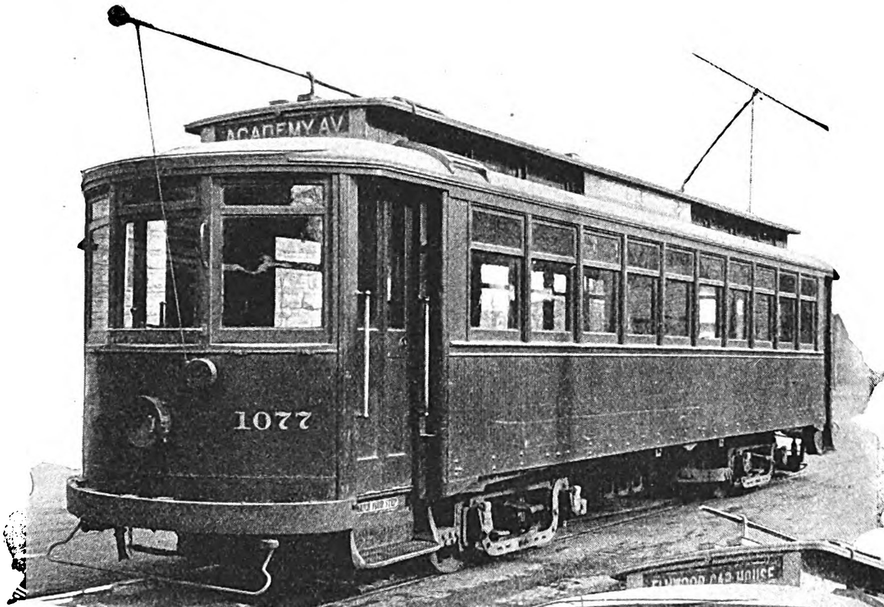
Just as Dead as If He Were Wrong

TO BE right is not enough. As a speaker at a recent meeting of electric railway men pointed out, it is not always wise for a public utility company to maintain its rights too vigorously. He referred to the man who "was right, dead right . . . but he's just as dead as if he were wrong." Of course it is important to be right, but being right, the company often can gain more by waiving its right than by insisting upon it.

If the time limit of a transfer has expired a street car conductor is technically right in refusing it. When the passenger has honestly misunderstood the restrictions on the use of a transfer, however, the railway would do better to accept it with a polite explanation of the rules than to refuse it and make a permanent enemy of the passenger. When some one boards the wrong car despite the conspicuous display of a correct destination sign it is the poorest kind of policy to chide him for his mistake or inquire rudely if he cannot read. Rather should it be the railway's endeavor to put him on the proper car to reach his objective.

Multiplication of instances of this sort would be easy. Usually the company is actually right and the passenger in the wrong. To emphasize his mistake or "teach him a lesson" only antagonizes him. If this is the habitual attitude, the company soon earns the ill will of a large part of the public and eventually is likely to find himself just as dead as if it were wrong.

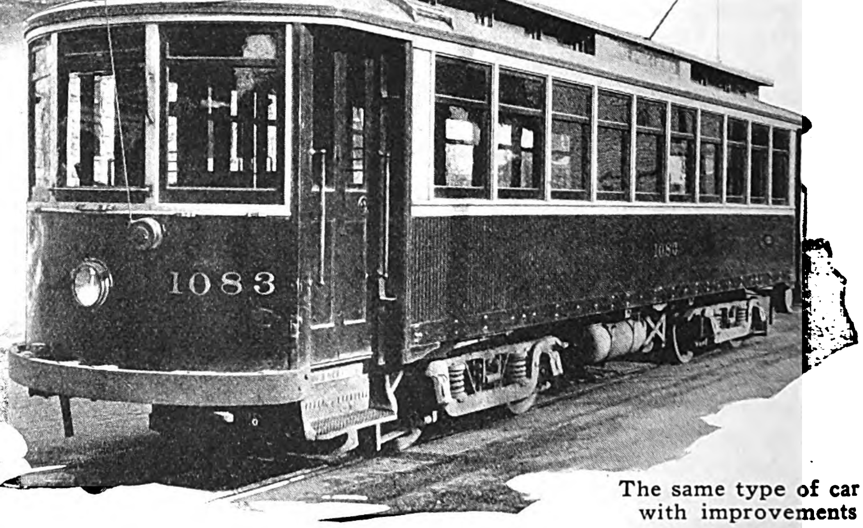
Good Service in Attractive Cars Increases Riding



Suburban car before rehabilitation

By E. J. Dickson
Vice-President
United Electric Railways,
Providence, R. I.

Passenger revenue of the United Electric Railways, Providence, R. I., increased 2.3 per cent from 1923 to 1926 despite extraordinary depression in business conditions and increased automobile registration of 46 per cent



The same type of car with improvements

PROPERLY to understand the results that have been obtained through the use of new and more attractive rolling stock on the lines of the United Electric Railways, Providence, R. I., it is necessary to consider several phases which have a direct bearing upon the results obtained. The railway operates practically all the electric car mileage in Rhode Island. During the five-year interval from 1920 to 1925 the population as shown by the federal and state census increased 74,863, or 12.39 per cent, an average of 2.48 per cent per annum. During the years 1923 to 1926 inclusive there was a gain in automobile registration of 45.79 per cent.

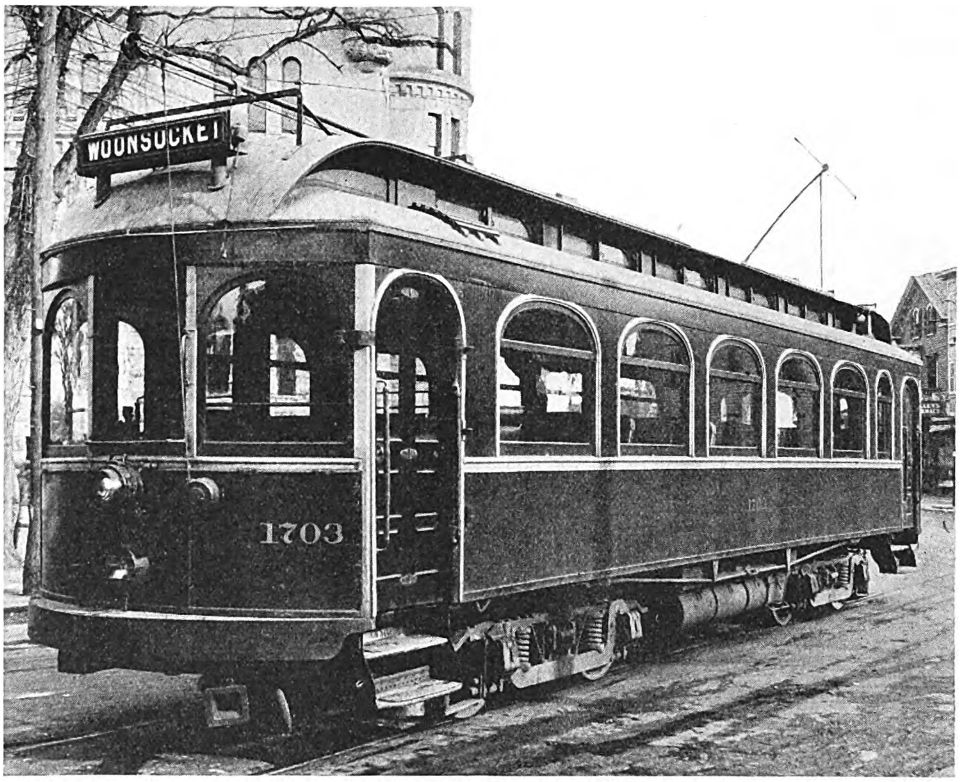
Most important in the state, considered commercially, financially, in size of plants and number of employees, is the textile industry. This alone gives normal employment to 85,000 wage earners. There are approximately 196,000 persons engaged industrially in the state, so that those employed in textiles constitute nearly half of the total. During the past four years the textile industry in New England has suffered an extraordinary depression. The intensity of that depression was most pronounced in 1926. Due to the large number of persons engaged in the textile industry, it is obvious that the barometer of business conditions fluctuates according to the state of business in textiles.

As this business suffered so extensively during the past four years, one might reasonably suppose that the electric railway revenues would decrease correspondingly. This was not the case, however, as is shown by the financial statements of the company, as follows:

Year	Gross Earnings
1923	$8,006,202.21
1924	8,179,322.41
1925	8,159,446.59
1926	8,193,345.17

The expansion in service and use of equipment to give greater convenience and comfort is shown by several changes which were made. The United Electric Railways instituted bus operation July 3, 1922, and has extended this operation to a very considerable extent up to the present. This service has been a contributing factor toward increasing gross receipts. In addition, on Jan. 1, 1924, and again on May 27, 1924, fares were increased and several zones were extended. This caused a considerable loss in traffic, but the revenue remained about stationary. Progressively since Dec. 31, 1922, the company has purchased 235 cars of the most modern city type, 210 of them being double-truck cars designed for one-man or two-man operation.

During 1926 the company instituted a program for improving the appearance of its equipment by the adoption of a more attractive color scheme. Cars are being painted to the new standard as they go through the shops for general overhauling. The company has also devised a plan for rehabilitating the best of its older equipment by improving interior and exterior decorations, illumination and seating. Some of the results achieved in connection with this program of improvements are indicated in the accompanying illustrations. Car 1703 is one of the high-speed interurban type used on the Providence-Woonsocket line. The original interior mahogany woodwork was refinished and the ceiling was painted a light cream. The seats, previously upholstered in plush, were recovered with Spanish grain leather. All cars on this line have been similarly rehabilitated.

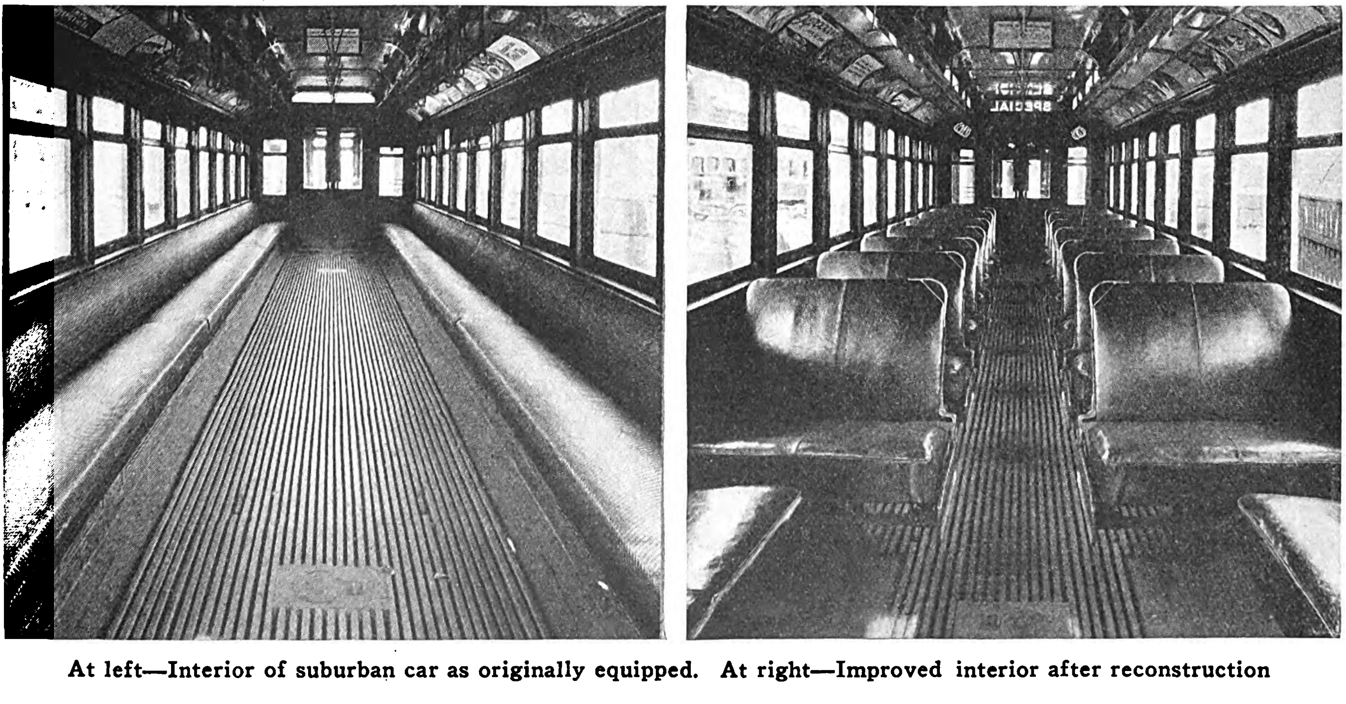


Exterior of one of the Providence-Woonsocket high-speed interurban cars after remodeling

Car 1083 is one operated on the East Greenwich suburban line. The improvements made in exterior appearance can be seen by comparing this with car 1057, with which it was originally identical. The interior of the remodeled car is provided with cushion leather seats. The ceiling is painted cream color and white enameled Rico handstraps have been installed. The interior woodwork also has been refinished and varnished.

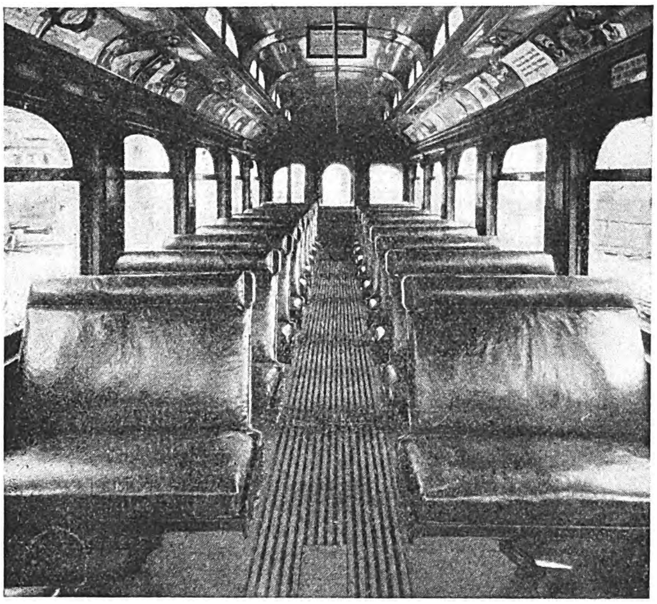
Besides purchasing 235 new cars and rehabilitating many others, this railway has been engaged diligently in other respects during the past four years. Many miles of track have been rebuilt. Sections of double track have replaced single track and single-track sidings have been lengthened. Automatic signals and electric track switches have also been installed liberally.

The power supply of the railway has been improved radically so that it is now giving excellent results. Frequency and regularity of car service have been established to such an extent that favorable comment has been received both from patrons and from the local press. Material financial economies in cost of operation



At left—Interior of suburban car as originally equipped. At right—Improved interior after reconstruction have been effected in all departments of the company and each department has responded with better efficiency.

Referring to the question as to results which can be attributed directly to better appearing cars with greater conveniences and comforts, I do not hesitate to state that, notwithstanding all the other agencies employed to attract patronage, it is my firm conviction that had not the United Electric Railways undertaken the purchase of new cars, improved the appearance and convenience of others and strengthened its track facilities the gross earnings of the company would by no means be where they are today.



Interior of car No. 1703. Seats have been re-covered with Spanish grain leather

You cannot sell shabby material to self-respecting people in these days. Unless good service is provided in attractive and comfortable street cars the ordinary citizen will purchase his own vehicle, or use the one he may already possess, instead of suffering the inconvenience resulting from irregularity of service or the humiliation of riding in dilapidated equipment. I believe that profitable street car patronage can be had in any community where such facilities are provided and if good service is given in attractive cars. These factors have been most helpful in our situation.

Lexington Capitalizes Magnetic Brake

THE Kentucky Traction & Terminal Company, which operates the car lines in Lexington, Ky., on a 100 per cent one-man basis, has recently employed a novel method for advertising the air magnetic brake which is part of the equipment on its rolling stock. A signboard suspended from the roof of each car from one end to the other and on both sides carries a slogan featuring the braking equipment. Some of the outstanding slogans are: "World's First Air-Magnetic Brake Car," "America's Model Railway—Air-Magnetic Brake," "Ride Electrically—Stop Magnetically," "Magnetic Brakes—Our Original Development," "Your Guard to Safety—America's First Combination Brakes."

Pressure Shower Bath Speeds Up Car Washing

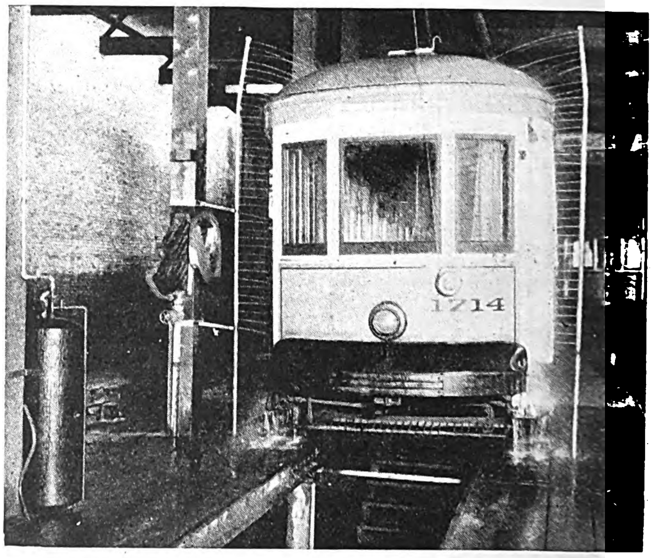
CAR-WASHING time has been cut in two at the Grand Avenue shops of the Connecticut Company, New Haven, as a result of the use of a pressure shower bath. The advantages of this method of cleaning the car exteriors was recognized some time ago, but it was found impossible to secure sufficient pressure from the city water mains to do the job properly. To overcome this difficulty J. E. Dooley, master mechanic, has devised apparatus whereby the shop compressed air system is used to force water through perforated pipes against the sides of the car.

A car air tank has been installed in a vertical position alongside the washing track. This is connected through a check valve to the city water supply. Outlet is provided through a second valve to two vertical 1-in. pipes, one on each side of the track. These pipes have $\frac{3}{32}$-in. holes spaced 3 in. apart. At the top they have been bent inward to direct the water onto the car roof.

Shop air is admitted into the top of the tank at about 80 lb. per square inch pressure. The check valve in the water feed line prevents water being forced back into the main. Thus the whole contents of the tank, about 41 gal., is driven out through the openings in the pipes.

This quantity of water is sufficient to spray a car twice. The first spraying wets down the sides and roof. Car cleaners then scrub them down with a cleaning mixture, using long-handled brushes. After that the car is run through the shower a second time for rinsing. A bleed valve in the tank releases the air and allows it to refill with water, a process requiring about 60 seconds. During this time the washed car is being taken away and a dirty car brought up.

Two men constitute a crew for this work. One runs the car while the other operates the shower. Each brushes down one side of the car.



Washing car in Connecticut Company shops

Compressed air admitted into the top of the tank at the left forces air out through perforated pipes against the side of the car.

Washing the roof every time the sides are washed has proved to be good policy. This prevents the accumulation of dirt that may later run down the sides during a rain storm, giving the car a streaked appearance.

Traffic Signals Fitted to Complicated Intersections

Special methods of signal control are employed at complicated crossings in Chicago to increase flexibility of traffic movements, reduce interference and cut delay at intersections

By L. M. Traiser
Special Traffic Engineer Chicago Surface Lines

REGULATION of traffic is in principal demand where streets cross or intersect. These intersections are indispensable, but under heavy traffic conditions they become points of obstruction to traffic flow. Consequently, some form of regulation and control becomes necessary to give ease and safety of movement with minimum delay. This can only be accomplished by considering all of the factors in each situation and designing the control system to meet the specific set of conditions encountered. The growing inadequacy of city streets to handle the traffic volume which continues to increase at a rapid rate makes it necessary to adopt every available means of expediting the movement of vehicles over the principal lanes of travel. The principle of the greatest good to the greatest number must govern traffic control under such conditions even though it becomes necessary to restrict less important movements and to eliminate certain conveniences that were permitted under less congested conditions. Elimination of cab stands and vehicle parking near heavy traffic intersections is often a necessary step. Left turns should also be prohibited when they add confusion out of proportion with the convenience which their retention affords.

Special methods of handling traffic at complicated intersections

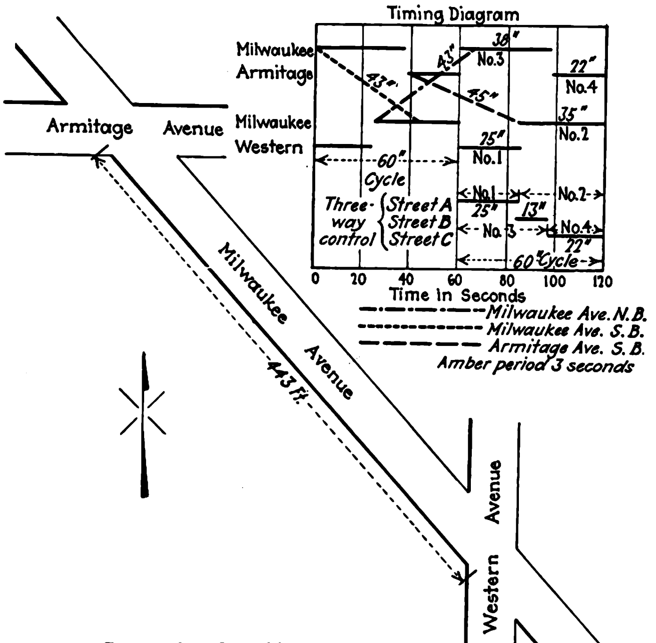
At the left—Traffic control arrangement designed to meet special conditions encountered at Devon Avenue, Sheridan Road and Broadway intersection in Chicago. Half the southbound traffic makes a west turn and 90 per cent of westbound vehicles turn right. The special method adopted to move this traffic is explained in the text of the article.

At the right—Intersection of Broadway, Clark Street and Diversey Parkway in Chicago. Both Broadway and Clark Street carry car lines and heavy vehicular traffic. Diversey Parkway is a heavily traveled boulevard. The scheduled sequence of the signal cycles used here is all-important to cutting down interference and delay.

To render these intersections most serviceable, enforced traffic restrictions must be combined with a method of control that will provide ease of movement with minimum time waste. Control by a traffic officer may be superior to mechanical control if the officer appreciates the time saving which results from short traffic change intervals and can give his full attention to this work. However, custom requires that traffic officers answer questions and enforce regulations. These demands, coupled with the common tendency to give long movements and wait for vehicles approaching the intersection widely spaced, decrease seriously the efficiency of manual control. Greater flexibility, less conflict of vehicles and a smaller time waste can be obtained with mechanical control at many intersections than would be possible under manual operation. This is particularly true at some of the complicated intersections encountered in a large city, which in the case of Chicago run through a wide range of conditions. Some of the special control installations now used or proposed in Chicago are designed for the following situations: Two or three streets intersecting at one point; closely related intersections on a heavy traffic street; three streets intersecting within close range but not at a common point.

SPECIAL CONTROL FOR UNUSUAL CONDITIONS

When two or more streets intersect at a common point and when the traffic arriving is not influenced by any near-by control system, the problem is one of giving proper consideration to traffic volumes on each street, the street widths and the prevailing directions in which the traffic must be moved through the intersections. This must be done in a manner to expedite the major traffic streams. Time must also be allotted in the control system to permit the movement of the minor traffic in a manner to give the greatest possible efficiency to the intersection.



Control of adjacent crossings co-ordinated

The intersections of Armitage Avenue and Western Avenue with Milwaukee Avenue in Chicago furnish an example of the interconnection of closely related crossings. The movement of street cars on all three streets controls the speed of the traffic stream due to the narrow streets and parked cars.

At certain intersections the predominating movements suggest a departure from the usual method of permitting traffic to flow in both directions at the same time on a given street. Such was the case in Chicago at the intersection of Broadway, Devon Avenue and Sheridan Road. An accompanying illustration shows a diagram of this intersection, the widening of which will be completed this summer. Here the two principal movements arrive southbound and westbound on Sheridan Road. Approximately half of the southbound traffic makes a left turn, while more than 90 per cent of the westbound vehicles make a right turn. The desirability of permitting these two streams to move simultaneously is supported by the ease with which the two remaining movements are combined. Twenty-five per cent of the northbound Broadway traffic, including street cars, turn left at this intersection, while essentially the only demand of eastbound traffic is for a right turn.

With the widening out of the northeast corner ample space will be made available for a through westbound traffic zone to be located as shown in the drawing. Vehicles will accumulate in this zone while Sheridan Road movements are running and will continue west with northbound left turns from Broadway. Such minor movements as left turns both east and west and through movement eastbound are prohibited. The intersection is so located that these restrictions cause very little inconvenience. A time cycle of 46 seconds for this location was determined by the 2¼-mile progressive signal system on North Broadway as part of which this intersection will operate.

CONTROLLING A THREE-STREET INTERSECTION

Another special control which falls under this classification is at Clark Street, Broadway and Diversey Parkway. This is a three-street intersection at which Broadway terminates. Here both north and south streets carry car lines in addition to heavy vehicular traffic. Diversey Parkway is a boulevard. A drawing of this intersection is shown in an accompanying illustration.

Under manual control two movements were given to traffic at this intersection, one for Diversey Parkway and the other for both Clark Street and Broadway. With this arrangement traffic southbound on Broadway conflicted, first, with vehicles northbound on Clark Street and then forced its way in with traffic southbound on Clark Street. Much delay arose from this interference.

With mechanical control and shorter intervals it was necessary to eliminate the conflict. This was done by using three-way control equipment timed as shown in the illustration. Here the scheduled sequence of the signal movements is all-important in cutting down interference and delay of the traffic streams. Starting with a 22-second movement on Diversey Parkway, followed by a fifteen-second period for southbound Broadway, the cycle is completed with a 25-second movement in both directions on Clark Street. By following Diversey Parkway, the short period allotted to southbound Broadway traffic permits faster speed and assures greater freedom from interruptions than if it were preceded by Clark Street, where northbound vehicles moving at a slower speed and passing the south side of the intersection during the amber period might frequently delay the Broadway traffic a large portion of the fifteen seconds allotted. Regulations prohibiting left turns to and from Diversey Parkway and eliminating parking on Clark Street from Diversey Parkway to Dole Street, one block south, were established while the intersection was under manual control and are continued at present.

This special method of control has eliminated all conflicting movements and permits much faster speed over the intersection than was formerly possible. A notable improvement over manual control has been observed.

When an important thoroughfare is intersected by streets only a few hundred feet apart and when traffic at these intersections warrants mechanical control much time waste may result if the controls are operated independently. Such conditions are found often on diagonal streets which frequently carry important car lines and much vehicular traffic. Generally, interconnection of control can be employed to advantage where the intersections are sufficiently closely related and where distances and intervening conditions permit a consistent running time for the traffic between intersections.

In Chicago eight such combinations are now in service. Mechanical control equipment operating two or three intersections on car line streets and boulevards has brought about a considerable time saving and a more uniform movement of vehicles. On Milwaukee Avenue there are two such groups, one of which is explained below.

Milwaukee Avenue, an important business and car line street, is crossed by Western Avenue running north and south and again within 500 ft. by Armitage Avenue, an east and west street. In this group of crossings heavy through traffic on Milwaukee Avenue demands first consideration. The intersecting car line streets, particularly Western Avenue, require a fair allotment of time to accommodate a moderately heavy cross traffic. Between these intersections the average running time of street cars was found to be 43 seconds in both directions on Milwaukee Avenue and 45 seconds for Armitage Avenue cars turning south on Milwaukee Avenue.

Here street cars control the speed of the traffic stream due to the frequency of car movements and the narrow roadway on which parking is permitted. Observations of running time include the period required to transfer passengers at the outgoing intersection. That is, the observation begins when the car leaves the first intersection and is concluded when it is ready to leave the second intersection.

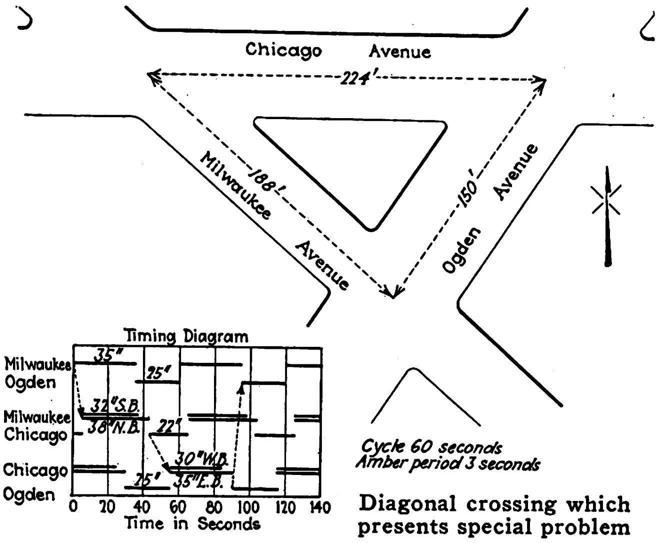
Applying this running time to the graphical timing diagram shown in another illustration it is found that southbound Milwaukee Avenue cars starting at the beginning of the movement at Armitage Avenue are ready to leave near the middle of the Milwaukee Avenue movement at Western Avenue. If this 43-second running time is now applied to a car northbound on Milwaukee Avenue starting with the "Go" signal at Western Avenue, the car will be ready to leave at Armitage Avenue eight seconds after the northbound movement starts. The graph also shows the movement for a branch of the Armitage Avenue car line which makes a right turn from east to south and continues down Milwaukee Avenue.

In this installation the intersections are timed to meet the individual needs of the various traffic streams and yet so related that movement at one intersection is given at the proper time to receive a wave of traffic from the other. An interesting feature of this installation came in the use of the common three-way control equipment to give this progressive movement. As shown in the graph this was accomplished by timing the controller 25 seconds on "A" street, thirteen seconds on "B" street and 22 seconds on "C" street and then making electrical connections to give movements at both intersections as shown. It should be noted here that the instant of change of traffic flow at one intersection need not coincide with the change at any other. Completely flexible control apparatus is usually necessary to permit such a fortunate combination of traffic flow. This arrangement, which is one of two such groups on Milwaukee Avenue, has controlled these intersections with notable smoothness for some months.

THREE ADJACENT BUT NOT COMMON STREET INTERSECTIONS CONTROLLED

Small islands are sometimes formed by three streets which intersect within a few hundred feet of a common point. When only two of these intersections need mechanical control the method just described may be used to advantage, but when heavy traffic requires mechanical control at all three crossings, interconnection with proper timing permits a freedom of movement impossible with separate controls.

When a distance less than 300 ft. separates these intersections, the resulting small reservoir capacity between crossings practically demands mechanical control of a type which will prevent accumulation between the crossings greater than the street space will handle. In a situation of this kind the signal changes will be governed chiefly by the traffic volumes to be accommodated at each intersection and the running time and temporary storage capacity between intersections.



Diagonal crossing which presents special problem

Still another traffic control situation is represented by this set of crossings in Chicago. Although the three crossings are adjacent, they are not common, and require the signal control to be worked out to meet the conditions encountered.

An example under this classification is the control soon to be installed at Chicago, Milwaukee and Ogden Avenues. At this location the first two streets carry important car lines and heavy vehicular traffic. Ogden Avenue is a boulevard. An accompanying illustration shows the arrangement of the intersections and a graphical timing diagram of the signal system.

Traffic on Milwaukee Avenue requires the largest time allotment, while Chicago Avenue follows next in importance. Small street space between intersections on Milwaukee Avenue northbound, Ogden Avenue southbound and to a lesser degree on Chicago Avenue eastbound makes necessary movements at the outgoing intersection on each street of sufficient length and so timed with respect to the incoming intersection that these small reservoirs will be emptied after each movement.

The graphical timing diagram shows how this was accomplished. A 35-second movement northbound on Milwaukee Avenue at Ogden Avenue is given a 38-second clear period, starting five seconds later at Chicago Avenue. An eastbound Chicago Avenue movement of 22 seconds at Milwaukee Avenue is given 35 seconds, starting twelve seconds later to clear at Ogden Avenue. Ogden Avenue flow at both intersections is of 25 seconds duration, but a five-second advantage is given the southbound movement at the outgoing intersection to prevent backing up of traffic which would interfere with Chicago Avenue.

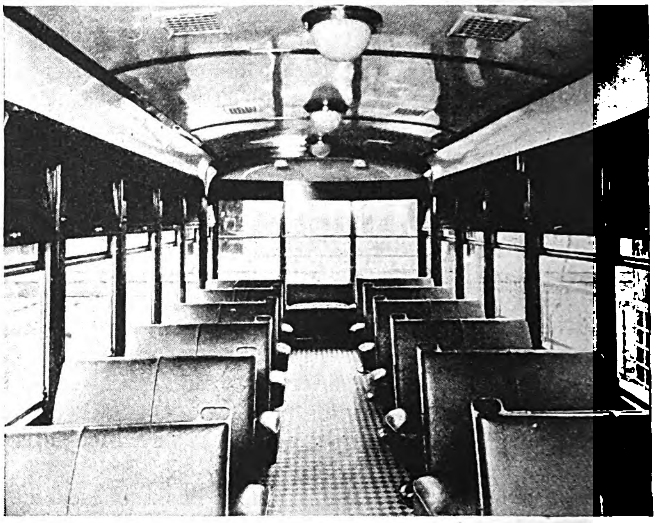
The other movements can readily be taken from the diagram. To prevent overloading of the reservoirs on the island side of the streets, the control on Milwaukee Avenue at Chicago Avenue and Chicago Avenue at Ogden Avenue must govern each direction separately. Therefore, where this flexibility is given in the timing diagram movements in each direction are shown independently. Proper vehicle flow is obtained by separate connection of lights on the two sides of certain of the signal standards. This measure of flexibility offered by mechanical signal control can be used to advantage at many intersections. Even though the control equipment required to give this flexibility is often costly, the time saving obtained is frequently worth many times the expenditure.

The Chicago, Milwaukee, Ogden Avenue group of specially controlled crossings is one of four such combinations in Chicago varying in distance between intersections up to 1,170 ft., where properly connected mechanical control has made possible conspicuous time saving and a more uniform traffic movement. The special methods of control mentioned or described here were developed for the city of Chicago by the Chicago Surface Lines.

New Cars for Jamestown Street Railway

Eight New One-Man de Luxe Safety Cars Purchased—Attractive New Color Scheme Adopted—No Expense Spared in Making These Cars the Latest in Car Construction

FULL realization of the importance of modernization of equipment to obtain increased patronage and reduced maintenance expenses caused the Jamestown Street Railway, Jamestown, N. Y., to purchase eight new one-man de luxe safety cars for city operation. It is anticipated that the attractiveness of these cars, together with the high class of service they will render, will result in a marked increase in revenue.

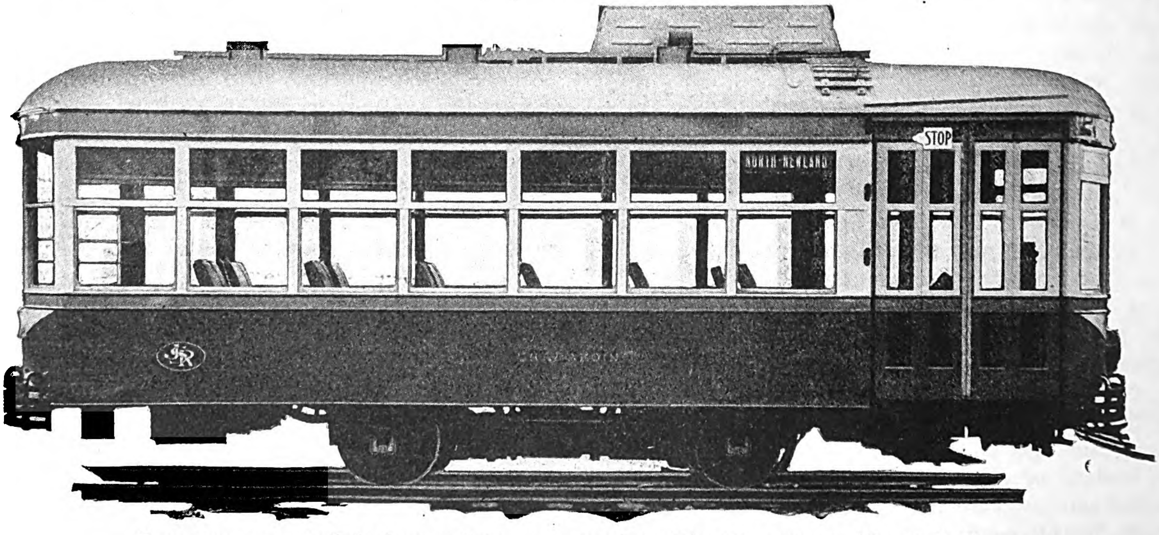


The arch roof, center-dome lighting, Spanish leather seats, and inlaid rubber tiling floor covering create a pleasing interior in the Jamestown cars

These cars, with their convex sides, round ends, arch roof and generally pleasing appearance, are expected to receive the unqualified approval of the public. Many new features are incorporated, one of which is the harmonizing color scheme. This consists of a pyramid gray body with a blue belt rail, desert sand letterboard and cream sash, all being blocked off by a horizontal black stripe. This combination of colors, together with the gray roof and black trucks, gives a pleasing appearance.

The cars were built by the St. Louis Car Company, St. Louis, Mo. Mahogany interior finish with white veneer headlining and gray trim afford a cheerful and restful effect. The broad, heavy upholstered welted seam seats with deep spring cushions and padded backs are covered with genuine Spanish leather, providing comfortable riding space for two persons. The cars have twelve stationary cross seats for two passengers each, one stationary longitudinal seat for one passenger, and a continuous seat across the rear end. Thirty passengers can be seated comfortably. Ample knee room is provided by the spacing of the seats at 31-in. centers.

The floors are covered with inlaid rubber tiling, giv-



One-man-operated de luxe safety cars purchased by Jamestown Street Railway

EQUIPMENT USED ON NEW JAMESTOWN CARS

Type of car	Passenger safety, single truck
Seating capacity	30
Weight, total	19,000
Length over all	27 ft. 7 in.
Truck wheelbase	8 ft. 6 in.
Width over all	8 ft. 8½ in.
Height, rail to trolley base	11 ft. 11 in.
Body	Semi-steel and Plymetl
Interior trim	Mahogany
Headlining	Veneer
Roof	Arch
Air brakes	Westinghouse
Axles	4 in. heat treated
Bumpers	Four bar spring steel
Car signal system	Faraday
Car trimmings	Bronze
Compressors	Westinghouse DH-16
Conduits and junction boxes	Duraduct
Control	K-63G
Curtain fixtures	Curtain Supply Co.
Curtain material	Pantasote
Destination signs	Hunter
Door operating mechanism	Natl. Pneumatic
Energy-saving device	Economy meters
Fare boxes	Johnson
Fenders	HB lifeguards
Gears and pinions	General Electric
Hand brakes	Peacock
Headlights	Golden Glow..SM95
Journal boxes	St. Louis Car Co.
Lightning arresters	Westinghouse type K3
Motors	Two 265A, inside hung
Paint	Johnston
Safety devices	Safety Car Devices Co.
Sanders	two front, one rear
Sash fixtures	"Rex" brass
Seating material	Spanish leather
Slack adjuster	Gould
Springs	St. Louis Car Co.
Step treads	Kass
Trolley catchers	O.B.
Trolley base	U. S. 20-A
Trucks	St. Louis No. 7
Ventilators	Peerless
Wheels	Steel, 26 in.

ing a safe and comfortable footing for the passengers. Its colors blend softy into those of the car interior. This tiling also acts as a sound absorber to deaden truck noises. Six Peerless ventilators installed on the roof, three on either side, are fitted with grille and register. The cars are heated with individual double-coil truss plank heaters and the temperature is regulated by thermostatic control. One cab heater is also installed for the comfort of the operator and is supplied with a separate control.

Practically every type of safety device has been incorporated in these cars, including an emergency exit door on the left side at the extreme rear. Large folding selectively controlled air-operated doors permit of easy and unobstructed entrance and exit. When the door is open a stop sign attached to the exit door acts as a warning to approaching vehicles that passengers are alighting. The cars are provided with brilliant interior illumination, there being three Brascolite two-lamp dome fixtures on the ceiling, two rear platform lights, and two door lights, besides the usual farebox, sign, tail and head lamps. As an added feature, a stop light on the rear dash shows red when the air brakes are applied. Motor rheostats, usually installed beneath the car floor, are installed upon the roof. Suitable metallic covering permits of proper ventilation and prevents entrance of rain and snow.

All platform control apparatus is inclosed in mahogany cabinets, creating a neat and clean platform appearance. The large section plate-glass windows in the vestibule assure an unobstructed view at all times. The seven large windows on the right side of the car and the nine on the left side, with cross-bar window guards, provide a clear, unobstructed vision without danger of injury from passing cars.

A decided departure from the usual method of numbering has been adopted. Each car is named after an Indian chief whose name began with the letter "C." The names decided upon were Chautauqua, Chadakoin, Conewango, Chippewa, Cayuga, Cattaraugus, Cassadaga and Canadohta.

Some of the principal dimensions and data on the eight new cars are shown in the accompanying table.

Enviable Service Records in New York State

NEW YORK STATE RAILWAYS, Rochester lines, boast a total of 321 employees with 25 years or more of service. The oldest employee in point of service is Joseph W. Hicks, assistant to the president, with 60 years to his credit. Next in line comes his brother, Thomas, with 48 years. Third in rank is Dominic Rick, a workman with the railways for 45 years. Two motormen, James A. Behan and John Lynch, have been piloting cars in Rochester for 40 years. W. J. Whalen and Cole R. McCracken lead the list of conductors with 36 years of service each. In the executive class there's Donn Byrne, assistant treasurer, 42 years on the payroll; Benjamin C. Amesbury, superintendent of transportation, 37 years; F. D. Livernash, division superintendent, 37 years, and Bert E. Wilson, general passenger agent, who has chalked up 35 years.

Store Check at South Bend Shows Popularity of Railway

OUT of 25,863 customers checked at five leading stores at South Bend, Ind., on Saturday, March 19, 16,479, or 63.8 per cent, used public transportation vehicles. Those who came by street car represented 56.2 per cent of the total, while those coming by interurban and bus were 2.1 and 5.5 per cent respectively. Automobile users were 19.4 per cent and walkers 13.6 per cent. Figures showing by two-hour periods the number of users of each type of transportation are given in the accompanying table.

MEANS OF TRANSPORTATION USED BY SOUTH BEND STORE CUSTOMERS

Hours	Street Cars	Int. Cars	Bus	Auto	Walk	Bicycles	Buggy	Taxicab	Skates	Motorcycles	No Reply	Total
9-11 a.m.	1,762	40	184	281	304	2	1	...	..	..	56	2,630
11 a.m.-1 p.m.	2,695	79	290	548	600	4	4	...	..	..	114	4,534
1-3 p.m.	2,912	133	333	1,305	772	9	2	1	1	..	207	5,676
3-5 p.m.	4,249	199	337	1,927	1,252	7	5	1	2	2	290	8,271
5-7 p.m.	2,908	88	270	966	591	1	1	...	..	..	127	4,952
Total...	14,526	539	1,414	5,027	3,519	23	14	2	3	2	794	25,863
Per cent	56.2	2.1	5.5	19.4	13.6	..	..	0.1	..	..	3.1	100

High school girls wearing orange ribbons with the inscription "C., S. B. & N. I. Ry. C." were stationed at the store doors to make this check. As each customer entered, inquiry was made concerning the means of transportation used in reaching the store. This information was noted on a slip, which was then deposited in a box provided for the purpose.

Some skepticism was felt by the railway management about the wisdom of making the count on a Saturday. It was feared that the proportion of car riders might be rather small because those who stopped work at noon could go home, get out the automobile and take the whole family down town shopping. The results shown by the check were extremely gratifying to the management, although it was felt that a week day would have shown an even larger per cent of railway passengers.

Since the count was made the company has noted a considerable number of expressions of surprise from merchants and the general public at the large proportion of customers found to be using street cars to reach the stores.

Trackless Trolley Equipped with Pneumatic Tires

DEMONSTRATION of a trackless trolley equipped with large pneumatic tires was recently made before a group of transportation officials in Ipswich, England. The new vehicle received the approval of those present. Features of the vehicle are:

1. Pneumatic tires on all wheels—38-in. x 7-in. single at the front and 38-in. x 7-in. twin at the rear.
2. Springs, specially long and designed to secure easy riding both with the vehicle light and in an overloaded condition, and to meet all conditions of road surface.
3. Body arranged with two compartments, between which is a wide central entrance for passengers with a low loading step. The floor of the vestibule is only 2 ft. 4 in. from the ground level.
4. Seats of the semi-bucket type, luxuriously upholstered in real leather.
5. Improved lighting arrangements in the form of bulkhead-type fittings having powerful electric lamps connected with the main driving circuit.

The chassis has the driving motor fixed within the frame in a position about midway between the front and the rear axles. The driving motor is of the inclosed-ventilated, series-wound traction type, with interpoles, developing 50 hp. on the standard rating of the British Electrical Standards Association specification for traction motors, and is capable of carrying an overload of 100 per cent for short periods.

The controller, which has been improved in many details, has a foot-gear for operating the main drum, while the reversing drum, which is mechanically interlocked with the main drum, is operated by a lever at the right of the driver. The main drum is arranged to give five series notches and one field shunting notch.

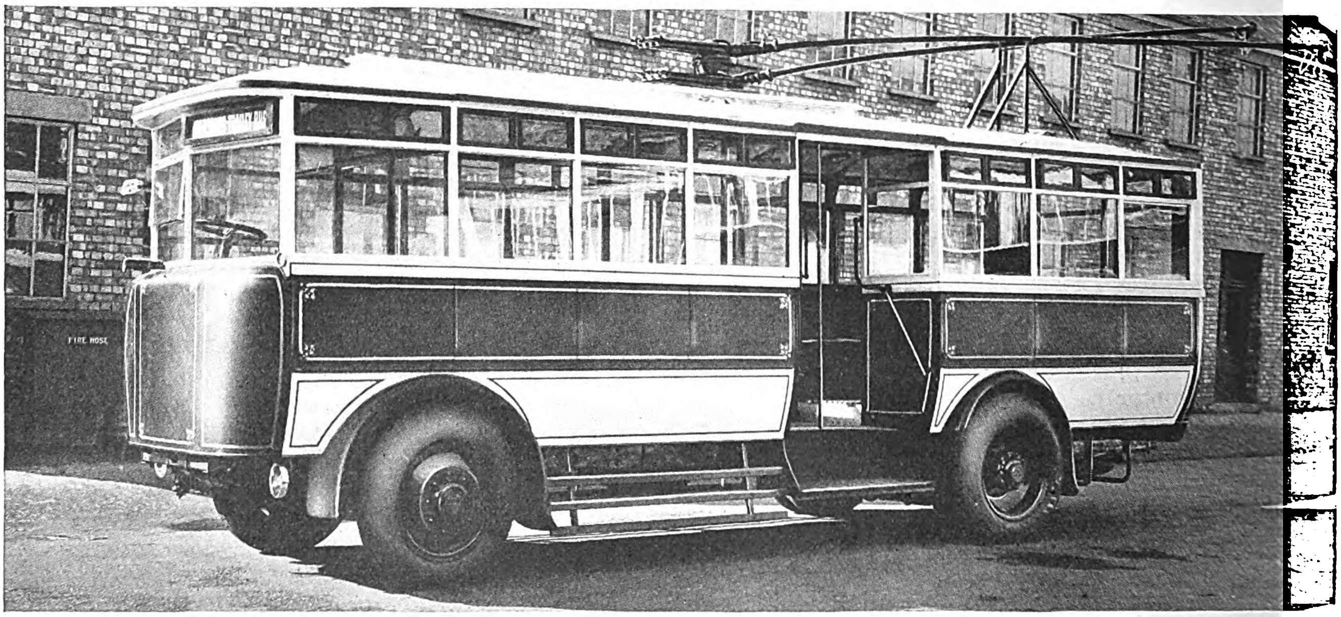
Power developed by the motor is transmitted to the back axle by a floating tubular propeller shaft of special steel, provided with inclosed universal joints at each end, the couplings of these joints, where attached to the motor shaft and to the worm shaft on the back axle, being provided with splines.

The back axle is forged from a steel billet, and is of the basin type for receiving the differential gear. The reduction in speed from the motor shaft to the driving axle is obtained by a specially heavy type of worm gear. At each end of this back axle a massive cast steel bracket is mounted, which carries the extra large brakeshoes and their cams.

Each driving wheel is fitted with two independent internal expanding brakes acting on large diameter drums, One brake is applied by a hand lever of the ratchet pattern, the other is applied by a pedal. Each brake is of sufficient power independently to stop the vehicle under all conditions.

All bearings throughout the vehicle are of the roller type, including those in the motor. With the exception of the worm and differential gear in the back axle, which are lubricated by oil, all other parts where lubrication is required are arranged for grease, nipples being provided at each point for use with a grease gun.

The body, built throughout by Ransomes, Sims & Jefferies, Ltd., has a wide central entrance with a compartment on each side of the vestibule. The front compartment accommodates fourteen passengers and the rear saloon seventeen passengers. There is also a comfortable seat for three passengers on the offside of the vestibule. The backs of the back rests are covered with carpet, which lends a cosy appearance to the interior. The steps to the central entrance are low, and the floor of the vestibule is only 2 ft. 4 in. from the ground level.



Center-door trackless trolley recently developed in England

English oak and ash, naturally seasoned, are used in the construction of the body. The outer panels are of silver steel. The exterior of the vehicle is painted in artistic style and the interior is tastefully upholstered and decorated. The interior panels are embossed to match the leather of the upholstery, and the moldings are French-polished of a rich mahogany shade. The white enameled ceiling with its polished handrails and copper-oxidized lamps and fittings makes a very light finish.

Four roof ventilators are installed and the upper sash of the main side windows are hinged in a vertical plane, opening either forward to induce a current of fresh air, or rearward in order to extract heated air from the interior of the vehicle. Two main side windows in each saloon are arranged to drop.

Schedule Making and Checking

in Los Angeles

The methods used by the Los Angeles Railway follow somewhat unusual lines. The method of procedure from the traffic check to the finished schedule is discussed

SCHEDULES used by the Los Angeles Railway follow the general form of listing car and crew runs, but for many years the practice has been to typewrite the schedules rather than to have them drafted by hand. The upper part of a typical week-day schedule is reproduced. As will be seen, the car schedule is at the left, and shows in separate horizontal divisions the schedules of each car from the time it leaves the carhouse until it returns. The car schedule is broken up into "pieces," as operated by the different crews, each piece being marked with the crew number. In addition there is a condensed guide of work runs at the right side of the sheet, showing the time on and time off for each piece of work for each car.

TRAIN RUN NUMBER KEYED TO SCHEDULE

Information from which schedules are made up is obtained by traffic checks. The schedule department has a corps of ten traffic checkers experienced in this work riding the cars at all times. This plan has supplanted the earlier method of having conductors make traffic counts. To insure reliable counts by the checkers, they in turn are checked by department men who ride the cars.

Traffic counts are made on the various lines at points of peak traffic, covering headway and passengers carried. The checker tabulates the car number, train number, destination, passengers and time at which the car passed the checking point. It is upon this information that the revised headway is based.

When these forms reach the office, lines are drawn through the tabulation indicating twenty-minute periods. A summary is then made on a tabulation sheet, giving the total number of passengers carried through a traffic checking point in consecutive twenty-minute intervals, throughout the eighteen hours from 6 a.m. until midnight. This summary is posted on a tabulation sheet. From the tabulation a chart is drawn showing the number of passengers by twenty-minute periods. This assists materially in visualizing conditions on a particular line.

Heavy loads are immediately noticed on this tabulation and chart. With a predetermined standard of service established, it is possible to determine by reference to an arbitrary table just what number of cars should be run in a twenty-minute period to handle the load. If the number of cars as calculated is greater than the number indicated in the table, a revision in schedule is made to improve the service. Traffic checks are continually being made, as the seasonal riding habits of the public require changes in schedule to make the service economical.

Before a change is made in a schedule, however, the running time is checked to determine a proper normal running time upon which the revised schedule may be based. Checkers with experience in operating cars are used in this work. They note the way the motorman handles the car and indicate on their reports the speed of the car between time points. From fifteen to 25 rides are made through a time point before establishing a new running time. After the time for these rides has been averaged, an allowance of 30 seconds is made to give what is known as a normal running time.

Having established a normal running time between time points and between terminals, a schedule is set up based upon the headway as determined by the traffic

.E-3 Eagle Rock						
F-4 E.4th-Hoover						

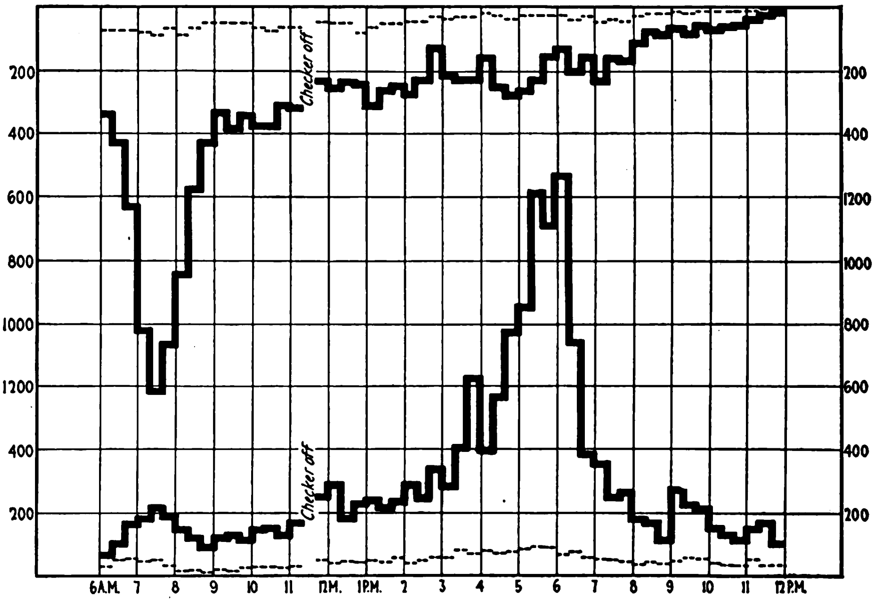
The actual mileage, loss, gain and schedule mileage are given for each line. This includes both car and bus operation

assigned this portion of the run to some work run number and thus has used it. Reliefs for the trainmen are allowed in the schedules. This company has no straight runs; there being at least a twenty-minute relief period at or near the center of the run in order that the crew may have time to eat. An exception is made to this in the case of the late night runs, that of necessity are made straight.

With the runs subdivided and portions assigned to work run numbers, the schedule is roughed out. It will be noted in the illustration showing the finished schedule that space is left for indication of the relief, when it comes on, and the work run number that relieves. The schedule is then typed on heavy bond paper, the work run table being placed on the right-hand side of the sheet, with the numbers listed consecutively. In the main schedule, the train run numbers are listed consecutively. This feature of the schedule makes it easy for the trainman to pick out the times of his work runs from the sheet. Particularly is this useful for the extra man who is given a run and has the allotted seven minutes in which to get his equipment together and copy off the times of his work runs. Checks have been made of the time required to obtain the same information from this form and from schedules not using the train run as a basis. With the Los Angeles system it requires 22 seconds for a trainman to find the two sections of his run and copy off the times. With a schedule in which the train run numbers are not keyed to the work run number, it required more than two minutes. Running time schedules vary with the time of day and are listed at the foot of the schedule. Altogether on the schedule shown there are seven changes in running times during the day in one direction and six in the other direction, though the difference between one time schedule and another may be between two or three points. The schedule shown was put into effect on Oct. 17 and covers the pre-Christmas season.

In setting up the running time in minutes between time points, no time is given between the last time point on the line and the terminal. The most important reason for this is that after a motorman leaves the last time point he is allowed to get to the terminal as fast as possible, taking into consideration safety of operation and courtesy. He will pick up few passengers, stopping principally to let off the few carried beyond his last time point, which usually is the last transfer point on the line. This speeding to the end of the line carries the few passengers left on the car to their destinations rapidly and creates public good will. Although no running time is given there is an established running time for this distance, which is available to trainmen and soon becomes known to them. However, they are permitted to make such time as they please. The time gained is added to the layover period.

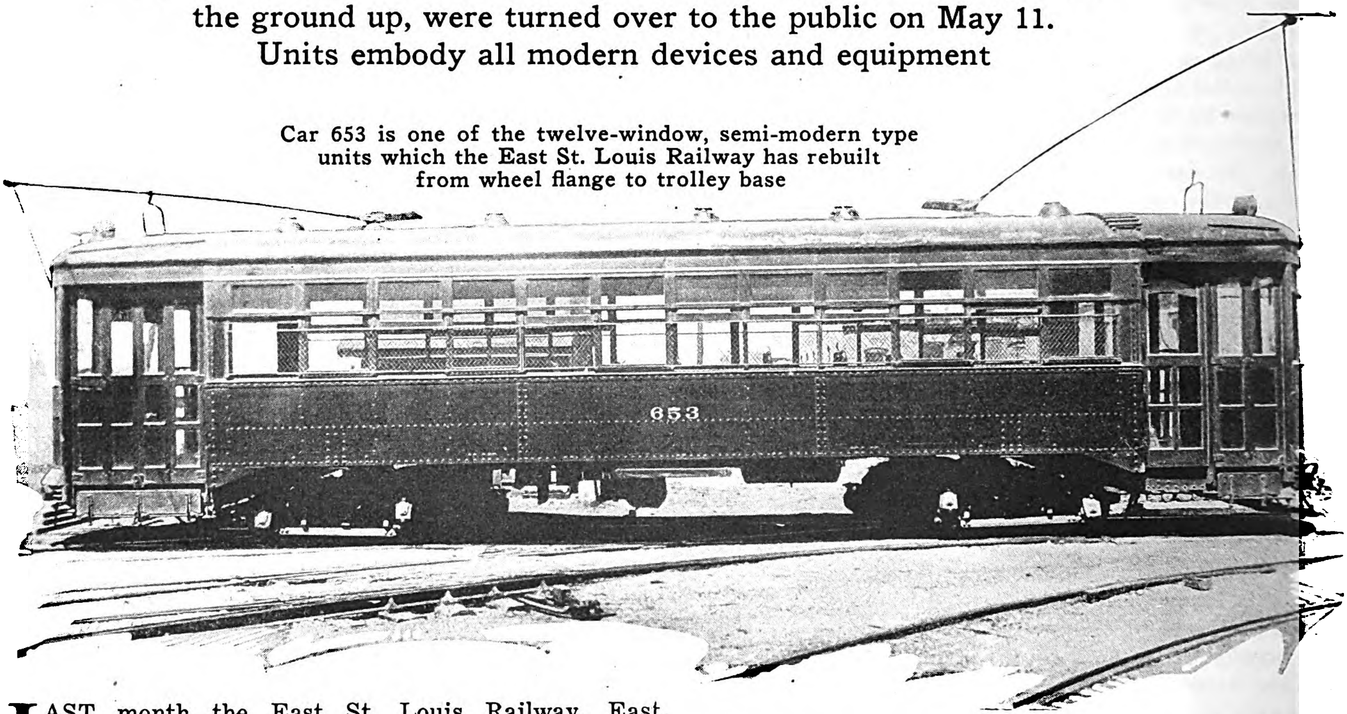
In addition to the work of making up schedules, the schedule department also compiles data on the car and bus mileage. These are made up on a form for each particular line for every day, and show the actual mileage on each individual car. In addition, another form shows the schedule mileage, the loss or gain and the actual mileage for each car line and bus line on the system. This is a daily recapitulation of the individual car and bus mileage sheet.



From the tabulation of traffic checks the usual chart is drawn to visualize the traffic situation. This graph indicates the number of passengers at a particular checking point for a twenty-minute period

Another Chapter on Popular Transportation

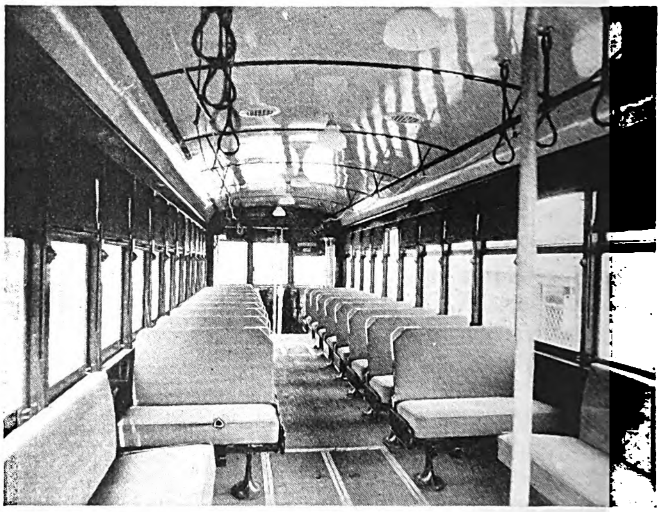
Six semi-modern cars, rebuilt by the East St. Louis Railway from the ground up, were turned over to the public on May 11. Units embody all modern devices and equipment



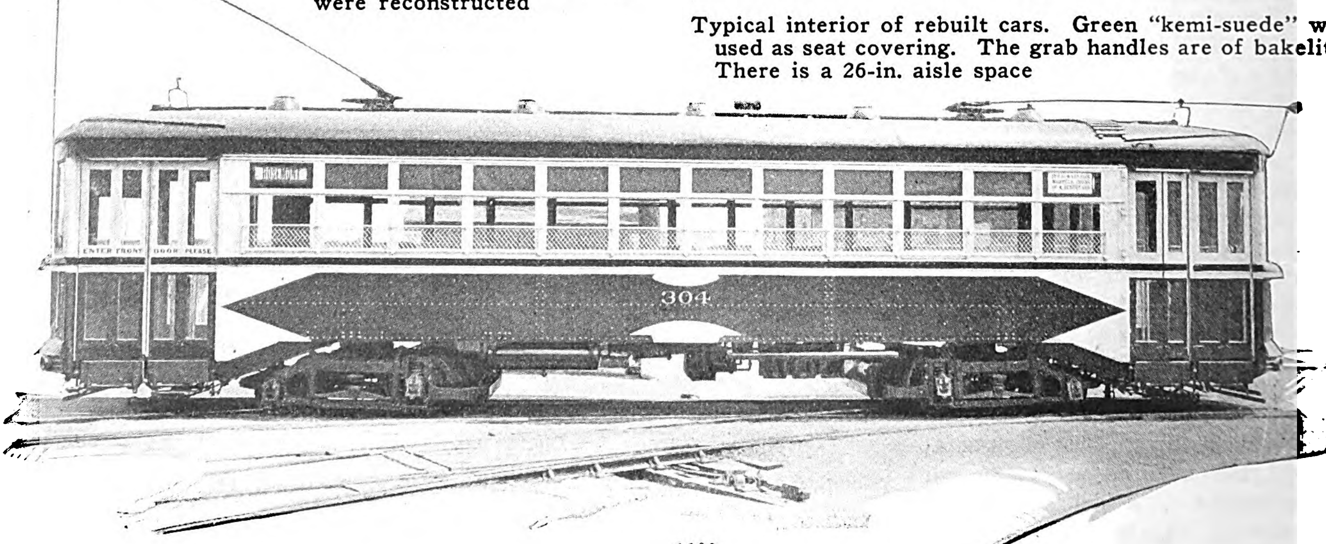
Car 653 is one of the twelve-window, semi-modern type units which the East St. Louis Railway has rebuilt from wheel flange to trolley base

LAST month the East St. Louis Railway, East St. Louis, Ill., wrote another chapter on popular transportation when six thoroughly rebuilt cars were shown to the public for the first time. The ceremony included a parade of the cars through the business district and over the divisions on which the cars will operate in the future. The units were placed in regular service on May 11. For the purpose of speed and on account of the scope of the reconditioning plan, the work was done in the shops of the St. Louis Car Company.

Modernization consisted, first, in completely stripping the cars, and, after the steel side plates and under frames were examined, the replacing of or welding all defective parts. The original interior finish of dark



Typical interior of rebuilt cars. Green "kemi-suede" was used as seat covering. The grab handles are of bakelite. There is a 26-in. aisle space



Car 304 is the same unit as shown above, ready to be placed in service. Six units were reconstructed mahogany was then refinished to a natural color, all defective parts first having been replaced. The interior metal trimmings also were refinished and headlining was installed. A new seating arrangement, consisting of eight cross seats per car placed on each side, and four short longitudinal seats, is in striking contrast to the old seating plan, which embodied five cross seats on each side of the car front and back, a long longitudinal seat opposite the cross seats and short longitudinal seats at each end on the same side as the cross seats. All of the new seats have deep spring cushions and backs and are covered with green "kemi-suede," a decided improvement over the rattan and wood construction of the old units.

New motors, geared for a speed of from 12 to 13 m.p.h., were installed on all the units; four 25-hp. motors on one unit and two 60-hp. motors on cars with maximum traction trucks. On the four-motor unit complete new wiring, a new light-weight truck and new electrical equipment were necessary, the latter including controllers and line switches. As an experiment the rewiring was done in Duraduct. Each car is equipped with full safety apparatus, including LD-4 devices for the operation of line switches. On each unit there are four air-operated doors; two have treadles and two are hand-operated. The doors are interlocked with control.

From the standpoint of boarding the car, considerable improvement is noted. This is due to the use of smaller wheels and because the unit as originally constructed contained drop platforms. Under the new arrangement the step heights are from 12 to 13 in., with a step from platform to the car body floor of 9 in.

As far as the exterior appearance is concerned, the company's standard orange color was specified as the basis for the new painting. The letterboard is painted orange and the window posts and windows are finished in cream color, below which has been traced a 4-in. black band, edged with old gold. In addition there is a 2-in. cream strip below the black band. This sets off a large orange colored panel which comes to a wedge point at the door posts. There are slight figures in the center of the panels to relieve the monotony. All parts are edged with black. By pointing the end of the side panels a streamline effect is obtained. Cream color has been used for the upper part of the doors, and the lower portion is finished in orange with the black and gold strip to match the decorative scheme of the car body. This treatment also obtains on the ends of the car. With the new headlight placed in the center of the dash, the orange panel effect has been extended to the dash, and brought to a wedge point at the headlight. Red was selected as the color for the car roof, with the under part finished in dark green.

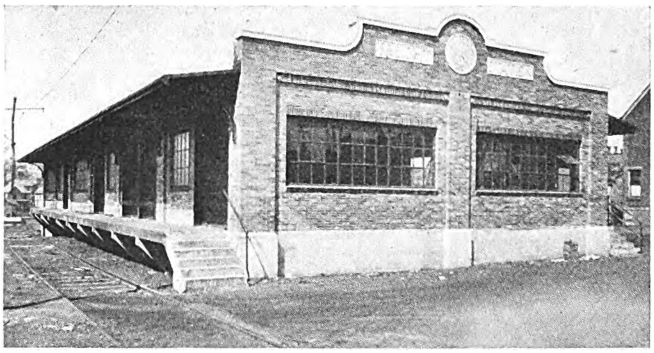
On the outside of the car there are also several new departures from the company's standards in regard to the location of different pieces of equipment. In addition to the headlights having been placed in the center of the dash instead of on the roof, which is standard with the company, the gongs have been installed under the platform floor instead of on the roof, thus freeing this portion of the car of the unsightly guard that was placed around them for protection against damage by the trolley poles. Other distinct departures consist of dash illumination and the reduction in the height of the window guards. One car is equipped with the round rod type, the others with fine mesh type of guard. To complete rehabilitation the cars were renumbered.

Terminal Improvements on West Penn System

ON APRIL 26 the West Penn System opened its new terminal and office building, freight station and garage, built at a cost of $400,000, in Greensburg, Pa. This terminal and office building combines dignity of design and utility. It is a two-story-and-basement structure extending 50 ft. on Main Street and 125 ft. paralleling Fourth Street. Glazed terra cotta columns grace the Main Street side and the front of the building, and they, with the extending canopy marquee on the south, the platform roof and the contrasting terra cotta face brick, make the building attractive in appearance.

Terminal and office building of the West Penn System recently opened at Greensburg, Pa.

The first floor of the terminal building contains the public waiting room. News-stands, telephone booths, checking cabinets and comfortable seats, with an excellent lighting system, make this room one offering real public service. At the south end of the first floor a large and attractive room is provided for the display and sale of electrical appliances for household use. Offices for local executives, the cashiers, train dispatchers and ticket agents are also on this floor.



A freight station and garage was also placed in service in Greensburg by the West Penn System

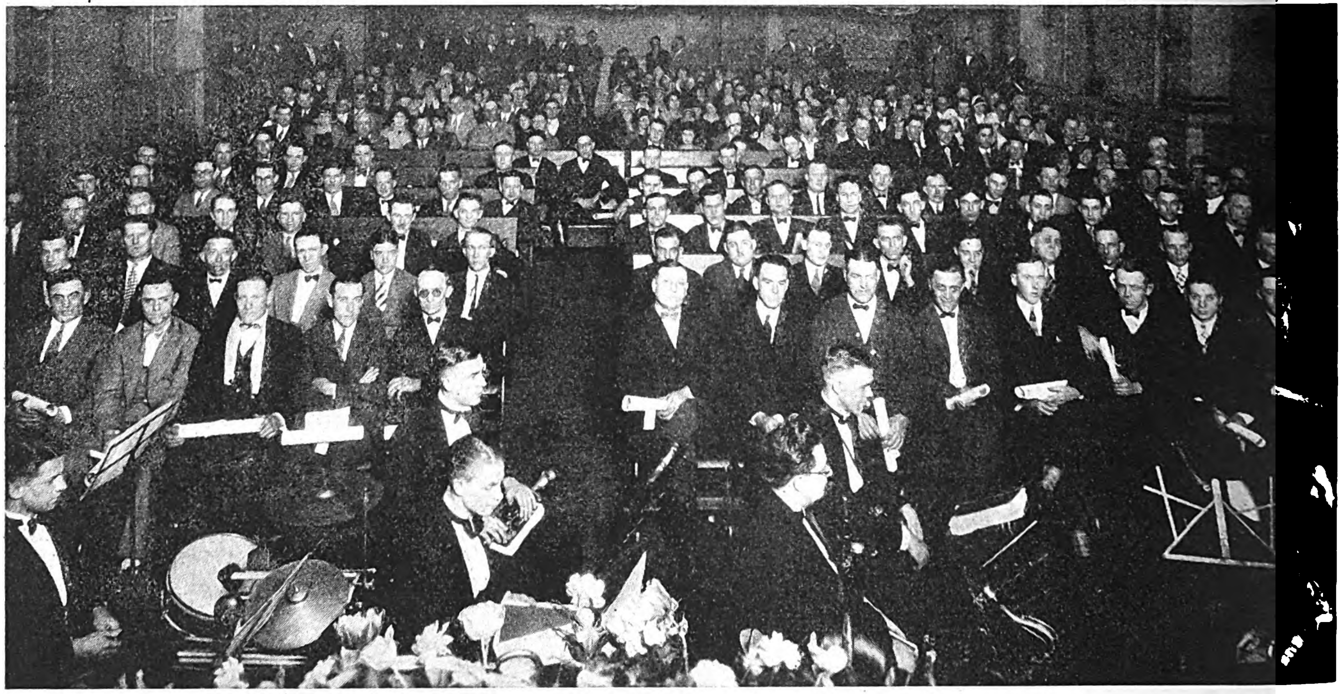
On the second floor a well-equipped room for the railway trainmen is located. Here also are the offices of the division auditor, the division manager and his assistant, the division engineer and the superintendent of construction. The interiors on both floors are finished in glazed brick wainscoting with white upper walls and ceilings. In the finished basement provision is made for storage rooms, the repair shop of the appliance department and the boiler rooms.

A freight station building has been in use for some time. It houses the storeroom for the Greensburg division and the garage.

The opening of this new terminal marks the completion of a series of major improvements made by the West Penn System in Greensburg at a total cost of upward of $400,000.

N. O. P. & L. Bus School Completes First Year

WHEN graduation exercises of the bus school of the Northern Ohio Power & Light Company were held recently at Akron, diplomas were awarded to approximately 200 operators. Although this school was first established a year ago, it did not get in full swing until some eight months ago, when a permanent school room was opened at the Kenmore carhouse. All bus operators have been required to attend one session of school each week. Sessions have been held daily at 10 a.m. and 4 p.m. except Saturday and Sunday. Each department is assigned a 30-minute period.



View of the graduating class of the N. O. P. & L. bus operators' school looking from the Elks auditorium stage toward the audience

The following subjects have been taught:

TRANSPORTATION DEPARTMENT

Company Organization—Operating rules, schedules, fare collections, reports, co-operation.

Bus Operation—Cleanliness of bus, personal appearance, heat and ventilation, personal conduct, accident and ejectment reports, care of injured and sick, care of persons asphyxiated. Prone-pressure method.

Public Relations—Courtesy, selling of service, information to the public, publicity.

General—Bulletins and special instructions, traffic rules and laws, handling of electric wires, selling company's securities, open discussion of all lessons.

MECHANICAL DEPARTMENT

Engine Troubles—General outline, motors, oiling, cooling system, carbon, ignition, gas and vacuum, review.

Chassis — Clutch, transmission, differential, propeller shaft, brake system, foot, shaft and rear axle, brake system level, brake system vacuum, front axle and steering gears.

Accessories — Tires, wheels and fenders, body, lighting, buzzers and horn, battery and starter, starting quick, stopping quick, open discussion at all lessons.

ACCIDENT PREVENTION DEPARTMENT

Accidents and Reports—The accident prevention department, what to do when accidents occur, when to make out accident reports, how to make out accident reports, why reports are required of all unusual occurrences on or near the bus, how to secure witnesses, their value, why they should be obtained, the effect of accidents on the company and the public.

Operation—Rough operation, speed, boulevard stops and right-of-way, safe operation at railway crossings, schedules and how to make them safely, buses colliding with other vehicles, bus collisions, bus and car collisions, making proper stops, review of past lessons.

General—Visiting while on duty, scuffling, playing jokes and results, individual accident records, the value of the accident record, fealty to the company, general review of the past 22 lessons, open discussion at all lessons.

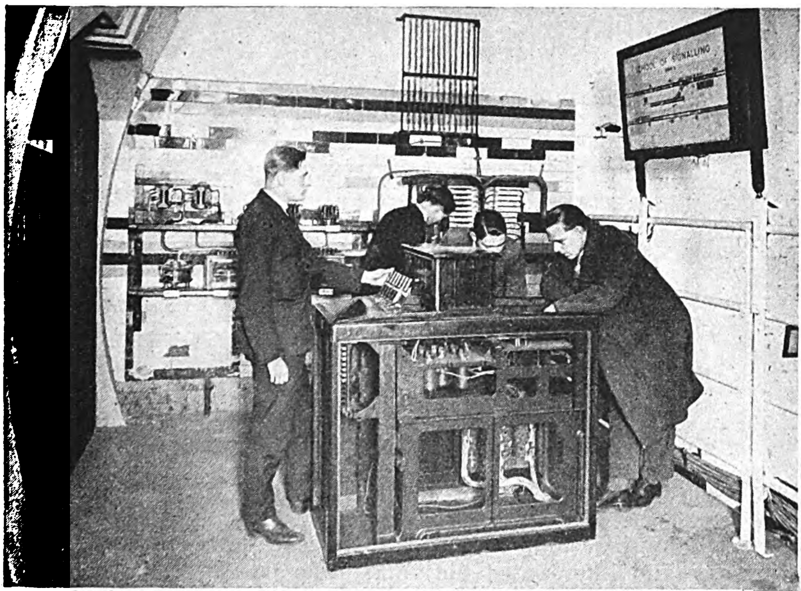
The school is in charge of J. K. Petty, who was taken from the ranks of the bus operators. The entire course has been given in a series of lectures and questions, a final examination being required for graduation. Practical demonstrations and work were given in connection with the lectures, the school room being fitted for that purpose.

Graduation exercises were held in the Elks Club auditorium, Akron, on April 20, at 10 o'clock in the morning and 8 o'clock in the evening—night operators receiving their diplomas in the forenoon and day operators receiving theirs in the evening. The exercises were attended by city officials, and Mayor D. C. Rybolt delivered the principal address in the morning and L. D. Carter, safety director of Akron, made the evening address. Diplomas were presented by A. C. Blinn, vice-president and general manager of the company. Wendell L. Willkie, of company chief counsel, presided. Music was supplied by the company orchestra.

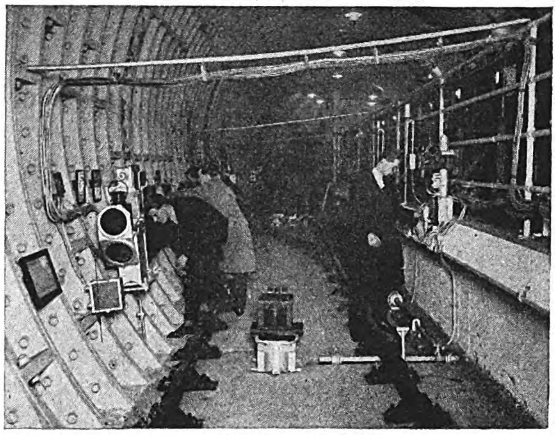
The company is planning the establishment of a school in Canton for the operators on the Southern division of the system.

A Signal School in a Tunnel

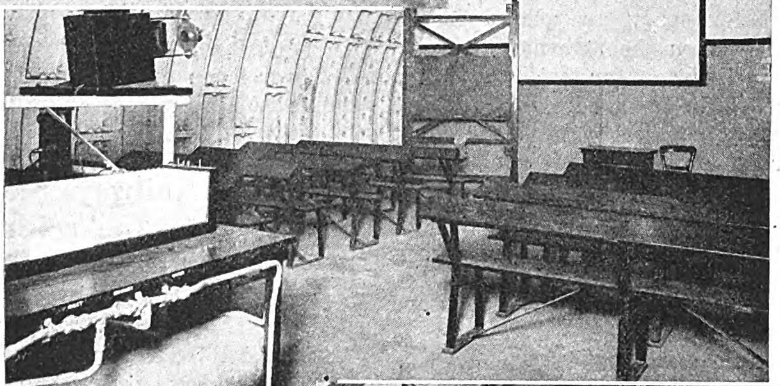
Classes for employees are held by London Underground Companies in unused section of South Kensington tube twice a week—Models of many kinds of signal apparatus are available for study



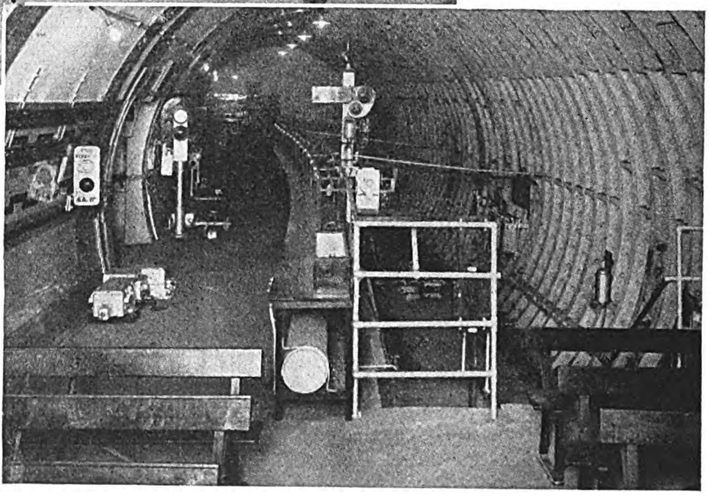
Above, signal interlocking frame with the casing removed



Above, electro-pneumatic tunnel signal



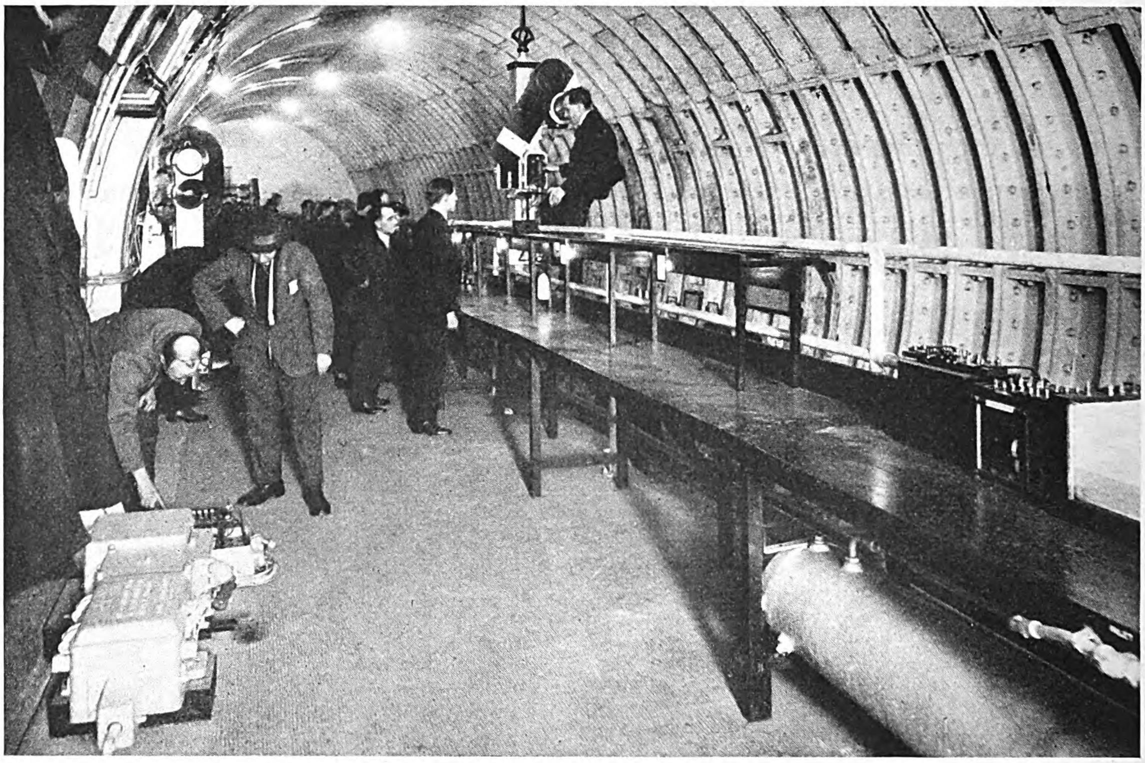
At right, the classroom of the London Underground signal school is provided with a projector and screen. Seats and desks accommodate 60 students



Below, experimental track circuit tank and fog repeater

OPPORTUNITIES for practical and technical training of signal linemen, fitters and installers are provided in a new school recently established by the London Underground Companies. Appropriately enough, the school is located in an unused section of the underground system at South Kensington. It is open to apprentices and signal linemen and to other employees who are interested in the work of the signal section and wish to prepare themselves for examination for better jobs. The method of training is to give a lecture in the school and to follow this by examination and experiment with the apparatus. The lecture room has a capacity of about 60 students. It is fitted with desks, blackboard, lantern and screen. Operation of the apparatus is explained and demonstrated by a qualified technical staff.

Monday evenings are devoted to exposition for apprentices of general principles, rules of signaling and operating practice. On Friday evenings the work is more advanced and covers all signaling, including the most recent a.c. installations. This is for the benefit of linemen and others who wish to keep in touch with the latest practice. At the end of each session an exam-

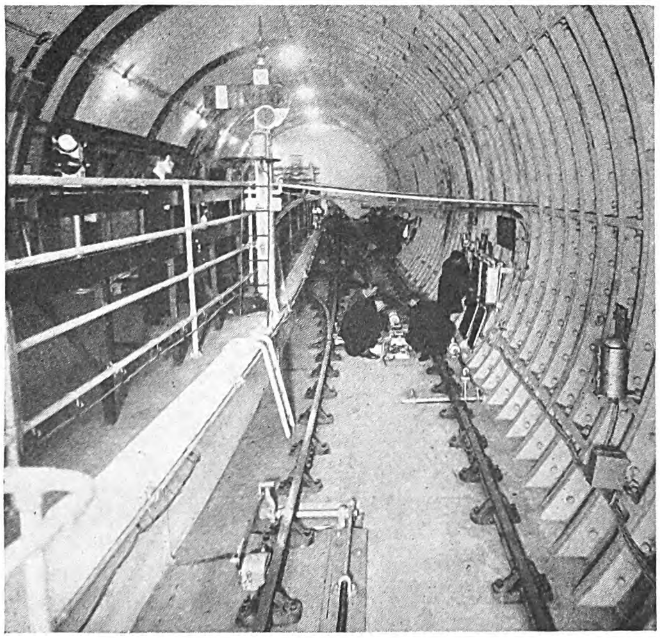


Daylight signal and semaphore

ination is held embracing both technical and practical work. The school is used also for the examination of individual linemen before they are placed in actual charge of signal sections on the railways.

An experimental track circuit for testing and demonstration purposes has been installed. By lowering or raising the water level in a nearby tank the effect of wet or dry weather on a track circuit can be demonstrated. On a bench running the length of the room is a miniature track. In front of the bench are arranged signals and train stops which are controlled from this track.

One end of the room is fitted up to represent a signal cabin complete with seven-lever power frame and illuminated diagram. The power frame controls five signals and one switch. A length of full-sized section of permanent way runs along the school on the lower level. In conjunction with this, signals and apparatus are connected up in the same manner as on the railways.



Switch mechanism and train stop showing circuit breaker box

Detroit Railways Show Enviable Decrease in Accident Figures

GROWING out of a campaign in the interest of safety, the Department of Street Railways, City of Detroit, Mich., reports an appreciable decrease in accidents for December, 1926. Analysis of the figures shows 36.5 accidents per 100,000 car-miles as compared with 39.1 for the same month in 1925, when the campaign was commenced by D. A. Smith, then general superintendent, and now general manager. According to another operating official of the company, other encouraging results are shown in the sphere of controllable accidents, the 1926 figures revealing only 15.9 accidents per 100,000 car-miles as against 23.9 for the previous year. The official last mentioned said:

"At the close of each month the operating division which has the smallest number of accidents is presented with a banner which is displayed in the carhouse. Each division is divided into teams of approximately fifteen men each and the members of the team which has the lowest accident record in the division are invited to a smoker given by the department. The competition for the division banners has become very keen and we anticipate even better results during the present year."

Maintenance Notes

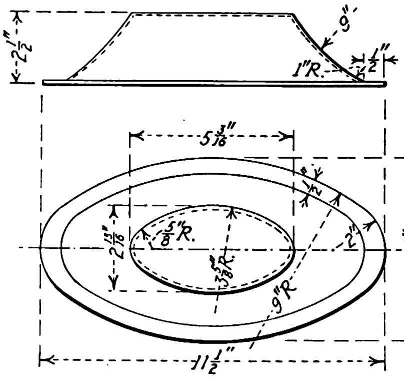
Economic Method of Salvaging Seat Pedestals

By A. M. Lindsay
Superintendent of Rolling Stock
Montreal Tramways, Montreal, Canada

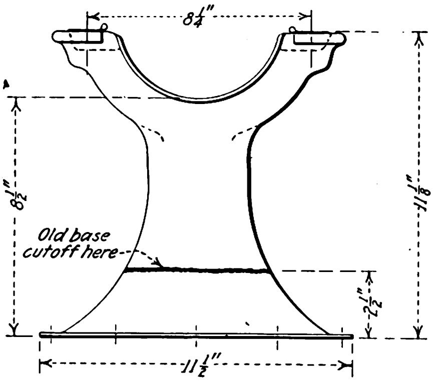
Bases of pressed steel car seat pedestals are subject to severe corrosion as they are in constant contact with the wet or moist floor of the car. The destructive action is more severe in some climates than others. The corrosion can be reduced materially and deterioration can be prevented by treating the bases when they are installed with one of the many adhesive asphaltic compounds on the market.

Finding that the deterioration of seat pedestals made it necessary to replace a large number of these on cars in service, a method of salvaging the old pedestals was worked out by the Montreal Tramways. This has proved satisfactory and economical. The various steps of the method are shown pictorially in the accompanying illustration. The method consists of cutting off the lower section of the pedestal which has deteriorated and replacing this with a new pressed steel section welded in place.

The first operation consisted of cutting off the defective pedestal with an acetylene torch on a line a little less than 2½ in. above the base. The upper portion of the pedestal is then placed in a jig and is milled accurately so that the cut will come exactly 2½ in. above the base line. The new seat pedestal base, made of a mild steel pressing which corresponds closely to the base portion removed, is drilled for the holding down screws and then is spot welded to the old pedestal top at four points. The assembled pedestal is then revolved between centers, as shown in Fig. 3, and the two parts are welded completely at the junction line by an acetylene torch. The joint is then dressed up on an emery wheel and then, after being heated, the base is dipped in melted No. 1 Reeferite compound. After painting the pedestal is ready to be returned to service.



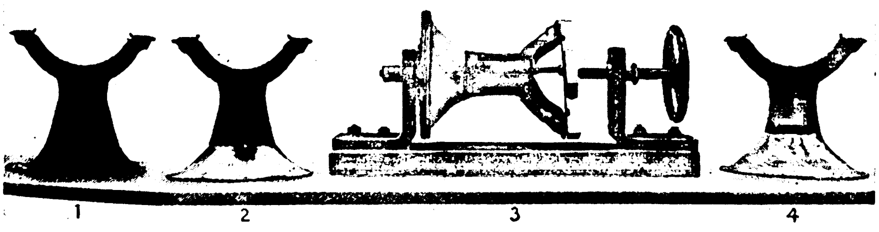
Seat pedestal base which is welded on



Detail of seat pedestal as reclaimed

The total cost of salvaging seat pedestals by this method is 84½ cents and is divided as follows:

	Cents
New pressed steel base	50
Drilling new base	1½
Cutting off old base	7
Milling pedestal	5
Welding and trimming	20
Dipping	1
Total	84½



Method of salvaging seat pedestals

The bottom of the pedestal is first cut off with the acetylene torch as shown in the illustration to the left and the new base is then spot welded into position as shown in the second illustration. By revolving the assembled pedestal between centers, as shown in Fig. 3, the entire junction seam is welded and the completed job, as shown in Fig. 4, is dressed up on an emery wheel.

Resistance Welder Used for Bonding Load

By J. E. Albert
Assistant to General Manager Charleston
Interurban Railroad, Charleston, W. Va.

Erratic loads in bond testing have been overcome by a method developed by the Charleston Interurban Railroad, Charleston, W. Va. The difficulty we experienced with the ordinary bond-testing equipment was that power usually was fed from two directions on the line. With cars pulling current from both sides of the bond tester a very erratic load condition on the tester resulted. The current would not be constant for any length of time and as a result bond testing was a hit or miss proposition and results were very unreliable.

To eliminate the unstable condition testing is now being done after 1 a.m., when no cars are operating. The power supply is shut off at one end of the line so that we are assured of power from one direction only. A constant load of a little over 100 amp. for the bond tester is drawn through the resistance units of an Indianapolis welder hooked up on a line car. Two men precede the car with a Roller-Smith bond tester and each joint is tested as rapidly as the tester can be read.

The accuracy obtained is remarkable. The reading indicates whether the bond is entirely bad or what proportion its resistance bears to that of a perfect bond. With a little experience the man reading the bond tester has been able to guess accurately the proportion of broken strands in the bond. This testing apparatus has been made a permanent part of our equipment and periodical inspections are now being made at night.

Protection for Commutator V-Bands

By John S. Dean

Renewal Parts Engineer Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa.

SATISFACTORY results are reported by a large railway from the application of dextrine and plaster of Paris mixed with shellac as a protection for the front V-bands of commutators. In mixing the compound shellac is poured into the powdered dextrine and plaster of Paris and is stirred thoroughly until a fairly heavy paint-like mixture is obtained that will just drop off of the mixing stick. If the mixture is too thick it will crack off when dry.

If the mica V-ring is in good condition the string or tape band can be left off. All short circuits should be removed carefully and the V-ring cleaned. The adjacent ends of the commutator bars should also be cleaned. It is particularly important to remove all dirt and oil at the points where the commutator bars join the mica V-ring. This cleaning can be done readily with a small wire brush.

After the cleaning, a coat of shellac should be spread over the V-ring and onto the adjacent ends of the commutator bars. Then one coat of the mixed dextrine and plaster of Paris compound should be put on with a small brush over the surface of the V-ring and the adjacent end of the commutator bars so as thoroughly to fill up all cracks and joints. After the compound has dried thoroughly in the air, not less than three coats of a good air drying insulating varnish should be used for a final finish.

Try this "B-Battery" in your railway motor hook-up, Bang-up Bearings By Better Babbitting.

That Stunt You Did *May Win*

HAVE you stopped to consider that the very job you were doing this morning may have prize-winning possibilities? Many of the things which appear commonplace, and are standard practice with your company, may be unknown to other electric railway maintenance men. It is the personal experience which you have gained in handling maintenance problems on your road that enrich the literature on this subject, and help other maintenance men to do the job better.

Progressive men always keep their eyes open and their minds alert for new ideas. They look ahead and improve their practice by availing themselves of the experience of others. They wish to know what is going on not only in their own field of work, but in the industry as a whole. These are the men who soon become leaders in improved maintenance. With this thought in mind, ELECTRIC RAILWAY JOURNAL is endeavoring to secure more information on desirable maintenance practices, and broadcast the best maintenance kinks through its new Maintenance Data Sheet section.

To help arouse interest several prizes will be awarded. Three capital prizes, the first of $200, the second, $100, and the third, $50, will be given to articles received before Aug. 1. In addition, a prize of $25 is to be given each month. This monthly prize is for the best maintenance idea published in the Maintenance Data Sheet section of the issue devoted to construction and maintenance, which is the third issue each month.

The next issue in which short articles contributed in the maintenance contest will be published is the June 18 issue. The time is getting short for you to get material into this particular issue, and the longer you wait the less chance you have of winning one of the monthly prizes in addition to a capital prize.

Three Capital Prizes

First **$200**
Second **$100**
Third .... **$ 50**

Condensed Rules for the Contest

Any employee of an operating electric railway or electric railway bus subsidiary may compete for the prizes to be given by ELECTRIC RAILWAY JOURNAL for short maintenance items. Full information is given in the April 16, 1927, issue, pages 700-701.

The author does not necessarily have to be the originator of the idea or device. An article may be submitted by several persons or by a department and need not be written by the person in whose name it is submitted.

Articles may treat of any maintenance practice or device used by any department of an electric railway and should be preferably 100 to 200 words in length and accompanied by one illustration. Brevity consistent with a proper presentation of information will be given weight in judging articles. In no event should they be longer than 400 words with more than two illustrations.

Manuscripts should be mailed to the editor of ELECTRIC RAILWAY JOURNAL, Tenth Avenue at 36th Street, New York, N. Y. To be eligible for the capital prizes, the envelope must bear a postmark dated before Aug. 1, 1927.

In addition, a prize of $25 will be awarded each month, beginning with the May 21, 1927, issue. Articles submitted will be published in the Maintenance Data Section of ELECTRIC RAILWAY JOURNAL.

If sketches accompany the manuscripts they may be in pencil, or blueprints will be accepted. Each item submitted should bear the name or names of the individual or individuals by whom it is submitted and to whom awards are to be made.

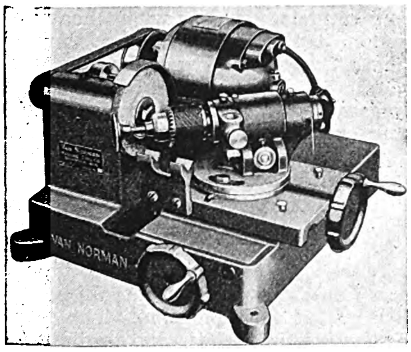
The announcement of the winner of each monthly contest will be made in the issue devoted to maintenance and construction, the third issue of the month, following the one containing the item.

The winners of the capital prizes will be announced in the Annual Convention Number of ELECTRIC RAILWAY JOURNAL, to be published in September, 1927.

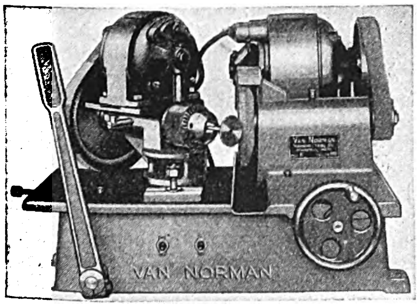
New Equipment Available

Valve Refacers for Bus Maintenance

VALVE refacers of two new types have been designed and are being manufactured by the Van Normal Machine Tool Company, Springfield, Mass. These machines are distributed by the Van Dorn Electric Tool Company, Cleveland, Ohio.



Type D motor-driven valve refacer for small service stations



Type E motor-driven valve refacer with double motor design and floating motor drive

The type D motor-driven valve refacer was designed to meet the need in smaller service stations and garages. It will grind all valves of ¼ in. to 7/16 in. stem diameter and valves having a head diameter of 4½ in. The machine has a universal workhead, graduated for settings at 30, 40, 45 and 50 deg. The workhead and the wheelhead are driven by a single flat belt through flexible shaft, worm and worm gear. A ¼-hp. Westinghouse motor supplies the necessary driving power.

The type E valve refacer is particularly good for heavy-duty work. It may be used for grinding valves up to ⅝ in. in stem diameter and 4½ in. head diameter. Valve reseating cutters and valve seat hones can be reground to the same angle as the ground valve. It is also applicable to grinding valve lifters, tappets, tappet screws, small spindle bolts and the like. The workhead can be turned to a 90-deg. angle with a slide range long enough to grind work having a maximum diameter of 2⅜ in. at the grinding point on the front face of grinding wheel. A 5-in. saucer wheel assists side wheel grinding.

The outstanding construction feature of this type E valve refacer is that it is driven by two motors, which make it possible to operate the wheelhead and workhead independently. These motors are of the high-torque, constant-speed type, insuring even grinding, and are of Westinghouse manufacture. A floating motor drive is another feature of this machine. In order to reduce vibration and thus produce better grinding the motor for driving the wheelhead is mounted slightly back of the center on a pivoted table, producing a spring tension against the pull of the belt. The V block and other standard features are included in the design of this type E refacer.

If you hesitate, procrastinate or miscalculate when you should lubricate, your bearings may have a terrible fate.

High-Low Water Alarm

A NEW signal panel has been designed by the General Electric Company for use as a warning signal to call an attendant in case of danger from overflow or emptying of a water tank. The panel is governed by one or two float switches.

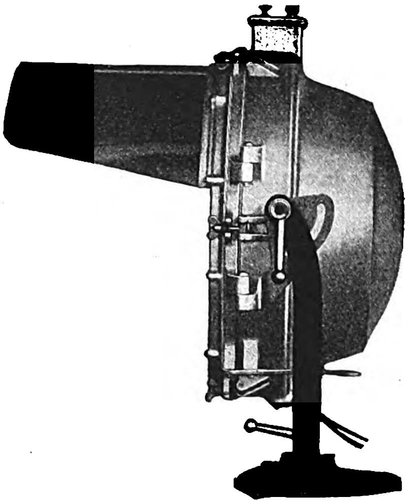
With this panel an audible signal sounds immediately when either the predetermined high or low level of water is reached. The gong can be silenced by the attendant upon his arrival, and the silencing switch does not have to be reset manually after the float switch takes a normal position. "High" and "low" signal lamps are provided, either of which lights when the predetermined level has been reached, remaining lit until the float takes a normal position.

The panel can be used for a one-level signal by omitting the float switch for the other level. It can also be used on pressure systems, but when single-pole float or pressure switches are used it is necessary to add a relay in place of the other pole.

Wide Angle Floodlight Projector

FOR use where long throw and high beam candle-power are essential a new 24-in. floodlight projector, known as type SCA-24, has been developed by the Westinghouse Electric & Manufacturing Company, particularly for railroad yard lighting and similar applications. The large diameter of the reflector in the new floodlight makes possible a wide angle of light with high over-all efficiency. Its long focal distance gives good beam concentration for long-range work, such as is particularly desirable in yard lighting.

The 24-in. parabolic chromium plated brass reflector is mounted in a cast aluminum alloy frame with a spun sheet aluminum back. The lens, of heat-resisting glass, is held in a door which opens from the front, swinging sideways. Thus it is possible to renew lamps and clean the reflector without interference from the door.



Side of floodlight projector

The floodlight is mounted so that it can be tilted upward where its position is such that approach from the front is not practical. A stop is provided so that it is unnecessary to aim the projector each time it is moved from position. Focal adjustment is provided by three screws, which operate independently, two for "in" and "out" and lateral motion of the lamp, and one for adjustment of focal distance from the reflector.

The reflector is entirely inclosed, no ventilation being required. It is furnished for either narrow or wide beam and with either a plain or spread lens. The visor is supplied as an accessory.

Association News & Discussions

Economics of Railroad Electrification*

By Sidney Withington

Electrical Engineer New York, New Haven & Hartford Railroad,
New Haven, Conn.

INSTALLATION of facilities for electric traction usually involves large amounts of additional capital, and it is obvious that unless the return from the electric operation—either direct or indirect—more than offsets the added fixed charges, including interests, depreciation, taxes, etc., the project cannot be justified.

The major advantage of electrification may be said in general to be fuel economy, either through the application of hydro-electric power, where such power is available, or through the use of steam power plants, where power can be economically generated. The steam locomotive has been improved recently by increasing steam pressures and by the application of such devices as mechanical stokers, feed water heaters, superheaters, limited cut-off, "boosters," etc., to a point where its efficiency in some cases may be as high as 8 per cent. This apparent efficiency, however, is reduced when losses incurred in "firing up," waiting at terminals and stations, operating at unfavorable loads, or coasting are considered. Poor handling on a run (where supervision is often difficult) may be a cause of decreased efficiency and wasted fuel. Fuel burned in a power plant is, by and large, burned under conditions favorable to economy. Individual machines exhausting at high vacuum can usually be operated at favorable loads. There is opportunity for good heat balance as a rule, and often an inferior quality of fuel may be utilized. Power plant operation at efficiencies of 20 per cent is not unusual. The power, of course, must be delivered from the power plant to the locomotives and thence converted into mechanical energy at the drawbar, and comparisons should be made on this basis, but even considering these losses, the overall fuel consumption under electric operation, other things being equal, is undoubtedly well under one-half that under steam operation.

The development of the Diesel electric locomotive may change the entire problem of economical railroad operation. The Diesel engine is of very high thermal efficiency and is in many ways a promising form of motive power. It is, however, now in its early stages of development, and is as yet available only in relatively small units. Not enough is known of its performance under operating conditions to determine how far its development will continue.

Another economy of electric operation is the maintenance of electric locomotives as compared to steam. This is especially true in the "engine house" expenses. The care of the electric locomotive at engine terminals is extremely simple compared to the attention which it is necessary to give to steam locomotives, which must undergo cleaning of fires, dumping of ashes, boiler washing, coaling, watering, and must be turned around at the end of each trip.

COMING MEETINGS
OF
Electric Railway and Allied Associations

June 6-8—**American Association of Engineers, annual convention, Tulsa, Okla.**

June 9-11—**Midwest Electric Railway Association, annual meeting, Hotel Chase, St. Louis, Mo.**

June 13-16—**National Association of Cost Accountants, annual convention, Palmer House, Chicago, Ill.**

June 15-16—**American Automobile Association, Motor Bus Division, Ritz Carlton Hotel, Philadelphia, Pa.**

June 19-23—**International Street and Interurban Railway Association, annual conference, Copenhagen, Denmark.**

June 20-24—**American Society for Testing Materials, 30th annual meeting, French Lick Springs Hotel, French Lick, Ind.**

June 20-24 — **American Institute Electrical Engineers, convention, Book-Cadillac Hotel, Detroit, Mich.**

June 24-25—**New York Electric Railway Association, annual meeting, Hotel Champlain, Bluff Point, N. Y.**

June 29-July 1 — **Central Electric Railway Association, summer meeting, Book-Cadillac Hotel, Detroit, Mich.**

June 30-July 1 — **Tramways and Light Railways Association, annual meeting, Bath, England.**

July 22-23—**Central Electric Railway Accountants' Association, Tuller Hotel, Detroit, Mich.**

July 27-29—**Association of Equipment Men, Southern Properties, 12th semi-annual meeting, Atlanta, Ga.**

Sept. 8—**Central Electric Railway Master Mechanics Association, South Bend, Ind.**

Oct. 3-7—**American Electric Railway Association, annual convention, and exhibit, Public Auditorium, Cleveland, Ohio. Exhibits open at noon of Oct. 1.**

There are numerous other advantages which may accrue on account of electrification in individual instances. One of these is abatement of smoke and noise. This is, of course, especially true in urban districts, but the advantages are difficult to evaluate, and it is easy to give them undue importance. The smoke from locomotives is usually but a small part of the smoke in the atmosphere of large cities. There is, however, sometimes a controlling motive in the elimination of smoke from long tunnels, not only where heavy passenger traffic is concerned, but also where freight is largely handled. The elimination of smoke automatically increases the capacity of tracks through long tunnels which often constitute limitations or "bottlenecks" in railroad operation.

Relief of Congestion May Justify Electrification

Track or terminal congestion has sometimes provided a controlling justification for electrification. The electric locomotive is practically unlimited in capacity, for additional units may be added almost indefinitely as required, all controlled by one crew. The capacity of the steam locomotive is controlled by track clearance and weight limitations and consequent mechanical considerations. Adding units of steam locomotives is not economical, as each added locomotive requires its own crew.

Congestion in terminals has in some special instances been relieved by electric operation, and in Philadelphia the necessity for general rearrangement of facilities was postponed by electrifying the suburban service. Electric traction made possible the operation on two levels of the passenger yard at the Grand Central Terminal at New York, and the utilization of the territory over the tracks for revenue-producing buildings.

Electrified suburban operation provides a solution for a number of problems. With motors installed on the cars themselves, operated as multiple unit equipment, rapid acceleration is possible, which in turn means faster schedules, especially where stops are frequent. Switching problems are, to some extent, simplified. Suburban electrification, however, means duplication of engine facilities at the end of the suburban territory, and this involves heavy expense which it may be difficult to justify.

Electrification has been of great value in mountainous country in making regeneration of power possible on long, descending grades. The absorption of the energy of a heavy train going down hill, by feeding it back into the power system where it can be usefully employed, is far more desirable than using such energy up in heating brakeshoes and wearing out car wheels.

---

*Abstract of a paper presented before the Affiliated Technical Societies of Boston, Feb. 17, 1927.

To balance the numerous advantages of electrification, there is first to be considered the very high initial cost of the new facilities which are required. These facilities may be roughly divided into three main parts: first, the power plant; second, the power distribution system to convey the power to the locomotive; and third, the locomotives themselves. The railroad must pay interest and taxes on each dollar of the investment which is required, and must also lay aside money for replacement when it becomes necessary through wear and tear or through obsolescence. These fixed charges constitute the first and perhaps the largest expense in connection with any electrification project.

INVESTMENT EXPENSE OF ELECTRIFICATION IS HEAVY

A railroad which is electrifying may find it desirable to purchase power instead of producing it in a plant of its own. If this is the case, the annual charges are still borne by the railroad, but are in the form of payments to the power company for the required power plant capacity to take care of interest and depreciation (or "replacement reserve") as figured by the power company.

The railroad must itself supply the funds for the construction of the power distribution system along the right of way. This is a large item and the annual charges are thus correspondingly heavy. The cost of maintaining the distribution system is one of the largest single items of expense of electric operation. This cost is not only direct, in the form of actual material and labor required, but also indirect, in the form of interference with operation while maintenance work is being performed.

The cost of the electric locomotives themselves is relatively high compared with steam locomotives of equivalent characteristics. This additional cost may in some instances be balanced by increased mileage, for the electric locomotive is available for service many more hours per year than the steam locomotive, but the demands of traffic, especially the so-called "fleet movement" of suburban service toward the city in the morning and from the city at night, often limits the mileage which can be made by the equipment, so it is usually the case that the electric motive power costs considerably more than the steam locomotives which are thereby displaced.

ELECTRIFICATION PROJECTS INAUGURATED FOR VARIOUS REASONS

Each railroad which has up to this time exchanged steam for electric operation has done so for some specific reason; that is, the solution of some local problem; and in few, if any, instances have general economic considerations solely governed. In each instance the electrification has well performed the requirements.

About a dozen steam railroad electrification projects, inaugurated for one reason or another, are in operation over more or less extensive territories, in addition to a number of electrically operated tunnels. The Chicago, Milwaukee & St. Paul, the Butte, Anaconda & Pacific and the Great Northern operate in mountainous country in the Northwest where fuel is extremely expensive and hydro-electric power exceptionally plentiful. Fuel saving and regeneration of power on long down grades were therefore controlling justifications, in spite of the fact that traffic density is relatively light. The Great Northern had also to consider operation through the long Cascade Tunnel.

The New York Central and Long Island Railroads operate heavy suburban passenger service electrically in the vicinity of New York. These projects were originally made necessary by tunnel operation. The Baltimore & Ohio at New York, the Pennsylvania at Philadelphia, the West Jersey & Seashore at Camden, and the Illinois Central at Chicago, each operates electrically heavy passenger suburban service. These electrifications were inaugurated on account of density of traffic on main line tracks, with few branch lines to complicate the installation and add to expenses of operation.

The Virginian and Norfolk & Western Railroads operate extremely heavy coal trains over tracks the capacity of which had been reached under steam operation. Trains up to 9,000 tons each are now handled by electric locomotives over heavy grades. The locomotives regenerate power going down hill, thus conserving energy and reducing wear and tear on brakeshoes and wheels.

ALL CLASSES OF SERVICE OPERATED ELECTRICALLY ON NEW HAVEN

The New York, New Haven & Hartford Railroad operates electrically between New York and New Haven local suburban service, through passenger service, freight service, and yard switching, and, through its subsidiary, the New York, Westchester & Boston, operates interurban service between New York and New Rochelle and White Plains. The New Haven is the only railroad in this country which thus operates on one system all branches of service electrically. The traffic is extremely dense, and the fact that it is so largely confined to one main line with few branches makes it ideal from the point of view of economical electric operation.

In addition to these examples of electric operation, a number of steam railroads are operating tunnels by electric power, utilizing electric locomotives to haul trains through the tunnels. Among these are the Pennsylvania at New York, the Baltimore & Ohio at Baltimore (this was the second oldest application of electric traction to steam railroads, the Nantasket Beach Branch of the New York, New Haven & Hartford having been the earliest), the Boston & Maine at North Adams (Hoosac Tunnel), the Grand Trunk at St. Clair Tunnel, and the Michigan Central at Detroit River.

ALTERNATING-CURRENT VS. DIRECT-CURRENT SYSTEM

There have been developed in this country two general systems of electrification—the alternating-current, or single-phase system, and the direct-current system. The single-phase system usually employs 11,000 volts in the trolley over the tracks at 25 cycles per second. The direct-current systems employ voltages which vary from 600 to 3,000. The lower voltages are distributed by third rail, while distribution above 1,200 volts is usually by means of overhead trolley. The chief exponents of the direct-current system at present are the Long Island, the West Jersey & Seashore, the New York Central, and the Baltimore & Ohio, all with third rail; and the Illinois Central, the Butte, Anaconda & Pacific, and the Chicago, Milwaukee & St. Paul, with overhead trolley. The principal single-phase systems are the Norfolk & Western, the Virginian, the Great Northern, the Pennsylvania, and the New York, New Haven & Hartford Railroad.

Each system has some advantages over the other, and each has its advocates, who enthusiastically support their opinions with loud voices. There is not yet sufficient information available to convince every one as to the undoubted superiority of one system or the other when all classes of service are considered, and thus to permit standardization throughout the entire country.

Public Utilities Advertising Association Will Stage Utility Copy Exhibit

AN EXHIBIT of public utility advertising is being arranged by the Public Utilities Advertising Association in connection with their meetings at the 23d annual convention of the International Advertising Association to be held June 27 and 28 at the Albany Hotel, Denver, Col. It is to be the only exhibit at the convention. Series after series of institutional advertising, a newly developed Washington dash sign and an extraordinary quantity of direct mail matter have been received and are to be included in the display. More than 7,000 proofs of utility advertising published in the past year have already been sent to Denver. Arrangements have been made with the Public Service Company of Colorado to set up a special exhibit in the windows of its Denver offices.

Frank LeRoy Blanchard, president Public Utilities Advertising Association, director of advertising and news Henry L. Doherty & Company, New York, N. Y., will preside.

The program is outlined below. The meetings will be held in the Magnolia Room:

Monday Afternoon, June 27, 2 P.M.

2:00. President's Address, Frank LeRoy Blanchard.

2:30. "Why National Utility Associations Believe in Advertising," by Paul S. Clapp, executive director National Electric Light Association, New York, N. Y.

Questions and Discussion.

3:00. "How to Buy Radio Time and What to Do with It," by Henry Obermeyer, assistant to vice-president Consolidated Gas Company, New York, N. Y.

Questions and Discussion.

3:45. "Why Newspapers?" by J. C. McQuiston, advertising manager Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa.

Questions and Discussion.—Other Media.

4:30. Report of Public Utilities Advertising Association Committee on Costs and Results, by its chairman, A. C. Watt, of

Hodenpyl, Hardy & Company, New York, N. Y.

5:00. Questions and discussion on addresses and papers of the afternoon session.

Tuesday Afternoon, June 28, 2 P.M.

Presiding: H. M. Lytle, vice-president Public Utilities Advertising Association, and vice-president Chicago Rapid Transit Company, Chicago, Ill.

2:00. "The Future of Organized Advertising," by W. Frank McClure, chairman Advertising Commission and vice-president Albert Frank & Company, Chicago, Ill.

2:30. "Percolators vs. Paris Hats—Advertising Appliances the Department Store Way," by Miss Dorothy Dignam, McJunkin Advertising Company, Chicago, and copywriter for Commonwealth Edison Electric Shops, Chicago, Ill.

Questions and Discussion.

3:15. "Advertising—And Informing the Public," by Labert St. Clair, director of advertising American Electric Railway Association, New York, N. Y.

Questions and Discussion.

4:00. "Where Does the Agency Fit In?" by James O'Shaughnessy, executive secretary, American Association of Advertising Agencies, New York, N. Y.

Questions and Discussion.

4:45. Report of Public Utilities Advertising Association Committee on Better Copy, by its chairman, Irving M. Tuteur, McJunkin Advertising Company, Chicago, Ill.

5:00. Questions and discussion on the addresses and papers of the afternoon session.

Plenty of Entertainment at C.E.R.A. Meeting

NUMEROUS entertainment features have been arranged by the program committee of the Central Electric Railway Association for the summer meeting, June 29 to July 1, as well as three business sessions. The latter will be conducted on Wednesday, Thursday and Friday mornings beginning sharply at 9:30 o'clock. Announcement of the subjects will be published in the form of a program and mailed to each member in about two or three weeks.

Afternoons and evenings during the meeting have been wholly set aside for the entertainment of the members, their families and such guests as they may wish to invite. On Wednesday afternoon there will be a tour through the Ford Motor Company plant. Wednesday evening an informal dinner and program of entertainment will be held at 6:45 o'clock followed by dancing in the Italian Room of the Book-Cadillac. On Thursday afternoon at 1:30 o'clock there will be an excursion to Bob-Lo Island, 18 miles south of Detroit, where there will be games and contests for the children and a golf tournament, dancing and other entertainment for the members. Ladies and children attending the convention may leave Detroit as early as 9:30 o'clock in the forenoon if they wish to spend the whole day at the resort. Entertainment on Thursday evening will be informal dancing in the Italian Room of the Book-Cadillac.

C.E.R.A. Traffic Association Meets

THE Central Electric Traffic Association held its convention at the Tuller Hotel, Detroit, Mich., on May 18 and 19. Reports of the standing and special committees were presented. Members present were: O. H. LaZelle, C. W. Randolph, H. G. Mason, C. D. Hardin, W. S. Rodger, N. Rumney, R. B. McEachran, R. Thompson, F. L. Ackerman, C. O. Sullivan, C. J. Laney, J. A. Greenland, W. S. Whitney, Mr. Herbert, G. W. Quackenbush, C. M. Byrne, F. L. Boyer, J. K. Coberly, R. M. Glick, V. T. Barry, W. L. Snodgrass, F. D. Norveil, W. L. Myers, C. J. Collins, A. E. Wafer, J. H. Crall, L. S. Gay, E. L. Hukill, H. W. Smith, O. A. Small, Mr. Craft, L. A. Goodrich, O. H. Murlin, J. O. Motto, E. Hamprecht.

Committees Named by Wisconsin Utilities Association

JOHN ST. JOHN, recently re-elected president of the Wisconsin Utilities Association, has appointed eleven general committees to carry on the research, educational, technical and accident prevention work for the new fiscal year. The chairmen and their committees follow:

Advisory—George H. Wilmarth, Eau Claire, chairman; L. N. Boisen, Chicago; R. B. Brown, J. P. Pulliam, S. B. Way, Milwaukee; G. C. Neff, John St. John, Madison; D. E. Callender, Racine, and Harold L. Geisse, Wausau.

Information Bureau—J. P. Pulliam, Milwaukee, chairman; John N. Cadby, Madison, secretary; R. B. Brown, S. B. Way, Milwaukee, and G. C. Neff, Madison.

Legislative—B. W. Arnold, Milwaukee, chairman; Harold L. Geisse, Wausau; George H. Wilmarth, Eau Claire; J. P. Pulliam and W. A. Jackson, Milwaukee.

Accident Prevention and Insurance—Ivan L. Scott, Madison, chairman; C. B. Boulet, W. Koehler, Milwaukee; M. R. Frederickson, Wausau; Lucinda Gothe, Ashland; W. H. Mann, Eau Claire, and J. W. Oliver, Waukegan.

History—Walter L. Haight, Racine, chairman; Ralph Drew, Wausau; A. R. Gale, Beloit; L. W. Cobler, Eau Claire, and F. W. Huels, Madison.

Educational—A. J. Goedjen, Menominee, Mich., chairman; F. W. Huels, Robert Quick, Madison; Arthur E. Johnson, Eau Claire, and A. J. Rowland, Milwaukee.

Preservation of Structures—James G. Allen, Lake Geneva, chairman; E. C. Brenner, E. J. Steinberg, Milwaukee; John C. Felton, La Crosse; R. M. Howard, Winona; E. J. Kallevang, Madison, and I. R. McCall, Chicago.

Women's—Mildred Manley, Lake Geneva, chairman; Amanda L. Buscher, Green Bay; Florence Clark, Lillian Minch, Madison; Mrs. Zilla R. McClure, Erna Burzlaff, Milwaukee, and Ruth C. Tarum, Eau Claire.

Co-operation with Educational Institutions—Harold L. Geisse, Wausau, chairman; W. C. Lounsbury, Superior; Lloyd V. Ballard, Beloit; W. C. Butterworth, Platteville; J. W. Dumont, Whitewater; W. A. Exner, Ripon; John G. Felton, La Crosse; Dean E. A. Fitzpatrick, Ewald Hasse, M. C. Potter, Milwaukee; Prof. S. W. Gilman, Geol P. Hambrecht, H. W. Schmidt, Madison, and Omar Loop, Superior.

Public Speaking—M. H. Frank, Fond du Lac, chairman; W. C. Butterworth, Platteville; J. G. Felton, La Crosse; F. A. Coffin, Milwaukee; C. A. Dow, Eau Claire; M. R. Frederickson, Wausau; Walter Haight, Racine; W. J. Hodgkins, Ashland; J. E. Horsman, Rice Lake; C. R. Phenicie, Green Bay; E. F. Rider, Oshkosh; R. C. Walter, Madison, and A. P. Gale, Beloit.

Subjects Announced for Wisconsin Accountants Meeting

ACCOUNTANTS of electric railway, electric and gas companies in Wisconsin will hold their annual convention at the Northland Hotel in Green Bay, June 17 and 18. James H. McGillan, Mayor of Green Bay, will address the convention on "Public Relations Between the Public Utility and the Community." L. E. Gettle, chairman of the Railroad Commission, will talk on "Valuation as Affected by Recent Court Decisions."

Speakers and their subjects at the first morning session will include R. E. Moody, Milwaukee, "Review of N.E.L.A. Accounting Section's Convention"; M. Gass, Milwaukee, "Proper Distribution of Costs in Automobiles, Trucks and Transportation Equipment." At the first afternoon session C. B. Boulet, Milwaukee, will talk on "The Accountant's Place in the Safety Program"; H. P. Taylor, Green Bay, "Employees' Education"; Robert J. Johnson, Milwaukee, "Accounting Problems in Connection with Industrial Gas and House Heating Customers."

The second morning session will be opened with a round-table discussion on "Accounting Problems in Connection with Bus Operation." Warren Montgomery, Madison, will lead the debate. J. E. Gray, Madison, will read a paper on "Apportioning Expenses Between Merchandising and Operation." Sam R. Hatch, Milwaukee, has for his subject, "Accounting Treatment of Property Retired." Previous to Mayor McGillan's address the section will elect officers for the new year.

Two other speakers will be added to the program, which will be concluded in the afternoon with an inspection trip through the new Bayside generating station and the offices of the Wisconsin Public Service Corporation.

A dinner and dance will be held at the Door Country Club in Sturgeon Bay the first evening. Convention arrangements are being made by D. W. Faber, A. L. Buscher, H. P. Taylor, L. C. Christiansen, L. P. Ziebell, L. P. Works and G. S. Meyrick of the Wisconsin Public Service Corporation, Green Bay.

American Association News

Service Betterment

FINAL committee reports were assembled at the meeting of the service betterment committee held May 27 at the association headquarters in New York. Notes and sub-committee reports had been developed by the chairman, S. E. Emmons, into a tentative report, and following a discussion on a number of items the report was completed.

Members present were E. A. Palmer, A. E. Potter, A. C. Spurr, J. C. Thirlwall, W. E. Thompson, C. D. Smith, John A. Dewhurst and S. E. Emmons, chairman.

The News of the Industry

Paving Relief Denied in Wheeling

Wheeling, W. Va., voters on May 26 rejected the proposed amendment to the city charter which would permit the Council to grant relief to electric railways from paving obligations by a vote of 9,225 to 7,716. The amendment, if ratified, would have empowered the City Council to determine when and where the railways should pave. The ordinances under which the railways now operate provide they shall pay for all paving between their tracks. The amendment was defeated despite a determined campaign of the Wheeling Traction Company, which advertised liberally in all the newspapers by letters and on the radio. A. C. Spurr, general manager, also made talks before all the civic clubs. The proposal was supported editorially by the newspapers.

New Transfers on Buffalo Local Lines

The International Railway, Buffalo, N. Y., adopted two new types of transfers on its local lines effective May 29. The new transfer system is aimed to speed up service on the one-man cars which now are being operated on almost every local line in the city. Under the system which has been in effect for a number of years operators were required to punch the time and the destination line of passengers.

One type now in use is for passengers who require a single transfer to reach their destination line. No other transfer will be issued when this type of transfer is presented by a passenger. The second type is for passengers who require two or more transfers to reach a destination line. This latter form has an attached stub, which is accepted as fare on the intersecting line, while the body of the transfer is retained by the passenger to be used on the third line. Passengers using this type of transfer are required to give the names of all lines over which they will travel to reach their destination, so that the names of the lines are punched upon the body of the transfer.

The transfers also are subdivided into in-bound and out-bound forms and the date is prominently displayed in boldface type upon the face of the transfer. The company believes these two new forms will eliminate much of the transfer abuse which has been detected in the past. Before the new transfer system went into effect the International Railway used a series of three-column 8-in. advertisements in the daily newspapers to acquaint car riders with the details of the new plan; posters were displayed on the dashboards of all cars and swinging signs telling of the change were placed inside all the local cars.

The first of the series of newspaper advertisements reproduced a typewritten letter signed by President Yungbluth and addressed to the car riders of Buffalo asking them to read the newspaper advertisements which were to follow. Later advertisements reproduced samples of the new transfers with a detailed description of how they were to be used. The company says this newspaper advertising campaign, linked with the car posters and swinging signs, helped riders to adopt the new system wihout any confusion.

Hearings on Chicago Bills Concluded

Amended Traction Bills Begin Course Through State Senate—Score of Amendments Suggested—New Bills Represent Tacit Agreement of City and Companies for Local Transportation Settlement

FINAL public hearings on the five Chicago bills which were introduced in the Legislature at Springfield on May 17 were concluded on May 31 by the joint legislative committee on public utilities and the documents were reported to the state Senate with recommendation that they be passed. The public discussion on the legislation, called for May 31, was cut short after a score or more amendments had been suggested by the local transportation committee of the Chicago City Council and a suggestion that Mayor Thompson of Chicago be invited to discuss the bills had been heard from Judge John M. Harlan, representative of F. J. Lisman & Company, who has vigorously opposed the bills at every turn. Of the various amendments urged, four were ultimately adopted by the committee and attached to the bills as they were sent to the Senate.

Summarized, the provisions in the amendments are as follows:

1. That no terminable permit can be granted and become effective without submission to a referendum.
2. Power of the Governor to appoint all employees, fix salaries and supervise all expenditures of the proposed county transit commission is removed.
3. The city of Chicago is to be relieved of the necessity of assuring the cost of moving public utility properties which would have to be relocated during construction of subway.
4. Any permit or grant to a street railway running for less than a year shall not be held to be a terminable permit.

Revisions recommended by the Chicago Aldermen, some of which were covered by the amendments approved by the committee, included:

1. Placing the expense of relocating public utility wires and conduits, etc., in the construction of subways on the companies instead of on the city as proposed in bill No. 1.
2. Permitting the city to grant either a terminable permit or a fixed term franchise.
3. Granting of power to the city to terminate indeterminate permits when the companies fail to make extensions or render efficient service.
4. Giving the power to the surface lines as well as the elevated lines to acquire other local transportation facilities.
5. Submission of all railroads doing a local or suburban business within the district to the jurisdiction of the proposed transit commission.
6. Appointment of all five members of this commission by the Mayor of Chicago, thus removing the Governor's control over the board.
7. Substitution of the Durso and McCluggage home rule bills for the present bill which proposes to create a county transit commission.
8. Issuance of terminable permits only after a public referendum. In addition to the proposals made by the Aldermen, the legislative committee listened to several prominent Chicago real estate men and bankers who expressed themselves as being highly favorable to the indeterminate permit.

The first and fourth amendments were offered by Senator Richard J. Barr in behalf of attorneys for the transportation companies who originally introduced the bills. Amendment No. 1 supersedes a clause in bill No. 1 which provides that all grants made by the city following the passage of enabling legislation, regardless of duration, shall be indeterminate permits. This feature, it was pointed out by critics of the measure, would make it virtually impossible for the city to extend the present six-month Surface Lines franchises even for a single day, without giving the companies a perpetual grant.

In presenting amendment No. 4, Senator Barr explained that the framers of the bills had deemed it unnecessary to make provision for a public referendum inasmuch as the Governor of the state and the Mayor of Chicago had both previously announced that any plan for the settlement of the local transportation problems must first be submitted to popular vote before becoming an ordinance. Definite provision for a referendum, however, he said, was being inserted in the bill to satisfy members of the local transportation committee and other civic bodies.

Promising a complete and permanent solution of Chicago's complex twenty-year old railway problem, the new bills represent the tacit agreement of both city administration and local transportation companies as to legislative acts necessary to validate plans for a unified transit system. The documents themselves were sponsored and drafted by officials of the surface and elevated lines, but are understood to have met with the general approval of Mayor Thompson and the city administration.

Agreement Reached in Pontiac

Negotiations between the city of Pontiac, Mich., and the Detroit United Railway were concluded recently when the City Commission passed an ordinance, tentatively approved by Master in Chancery Sayres of the federal court.

The ordinance provides that the company lay new tracks on Saginaw and West Huron Streets, take up its third track on Saginaw Street, and pave the strip left open; place ten new double-truck cars in operation; abandon the downtown freight station; and deed to the city a strip of land in the center of West Huron Street, extending from Waldo Street to West Boulevard, the west city limits. It also provides that the present rate of fare be maintained. The city in return permits the company to operate its cars on a day-to-day basis, terminable on 30 days notice.

Despite the fact that franchise on some lines expired two years ago, the company has continued to operate its cars on a day-to-day agreement. In view of the settlement it is expected the hearing on the city's petition in federal court asking the receiver to remove the tracks at the expiration of the franchises will be postponed.

Limitations Suggested for Broadcasting by Railways

The Federal Radio Commission does not look with favor on the granting of broadcasting licenses to electric railways where the principal purpose is to provide entertainment for the passengers on their cars. The feeling of the commission is that this service can be furnished effectively by "wired wireless" without further congesting the air. Serious consideration is being given the installation of loud speakers in the cars of electric railways in several cities.

Jersey Transit Body Urges 41st Street Tunnel Extension

Advantages that come to commuters of New Jersey from the construction of the proposed tunnel between the Times Square section of New York to New Durham, N. J., were demonstrated in a report of the North Jersey Transit Commission, made public on June 1. It is said the tunnel, designed to connect with the Interborough tunnel from Queens County, which now has its terminus at 41st Street and Seventh Avenue, would cost $33,000,000.

In connection with the report of probable traffic it was brought out that the commission has under consideration three methods of financing the undertaking. One is a bond issue similar to the plan used in financing interstate bridges; another is by the assessment plan taking into consideration the fares to be received, and the third is private financing with control exercised by some public body such as the Public Utilities Commission of New Jersey or the Interstate Commerce Commission.

The report shows that at the outset the tunnel would carry about 100,000 one-way passengers daily and that by 1945 this total would be increased more than 50 per cent. The report indicated that a competing tunnel to connect with the B.-M. T in West Fourteenth Street was considered. With suburban trains rerouted engineers found that the daily one-way traffic as of 1926 would be 95,508 and in 1945, 152,800. Considering the competing tunnel emergency the total in 1945 comes to 191,800.

It is estimated that the total traffic the tunnel would receive from the railroads would be about 41,437 passengers daily. In addition it would get 54,071 passengers from the ferries and the Hudson Tubes. The average rate of the fare mentioned in addition to the commutation rate has been figured out and ranges from 3.38 cents to as high as 12.65 cents.

Study of Providence Traffic Proposed

A bill has been passed by the Legislature of Rhode Island to create a board to be known as the Providence Thorofare Board in and for the city of Providence to consist of seven persons. This board is instructed by the act that creates it to familiarize itself thoroughly with the Providence traffic and thoroughfare plan approved by the City Council on Dec. 23, 1926, and with that plan as a basis and guide it is to proceed to prepare proposals for carrying out that project.

Broad powers of condemnation were conferred upon the new body. The act also authorizes the City Council of Providence to cause a special tax upon tangible personal property and real estate in the city. The board is to consist of three residents of the city, not members of the City Council, to be appointed by the Mayor, subject to the approval of the Council.

The legislation really has to do with the alleviation of traffic conditions in the city. By City Council resolution approved on April 11, 1925, a committee of the Council was authorized to make a thorough study and investigation of the traffic needs and requirements and their relation to all phases of the physical development of the city and to report to the City Council a comprehensive traffic and thoroughfare plan for the entire city, designed to meet the probable demands of growth and expansion for a long time.

Subsequently by city resolutions approved on June 5, 1925, the committee was authorized and empowered to secure the services of Robert Whitten, New York City, as consultant to assist the committee in the preparation and presentation of a plan of this kind. Mr. Whitten's plan has been referred to previously in the ELECTRIC RAILWAY JOURNAL, particularly the issue of Oct. 23, 1926, page 782, and the issue for Aug. 7, 1926, page 234.

In this connection it is interesting to note that grateful acknowledgment is made by the city planning consultant to the joint standing committee on ordnances of the City Council with respect to the courtesies extended to him by the United Electric Railways, Providence, in supplying data regarded by him as needful in his study, and for the co-operation of the officers of the company in the work which he undertook.

Through Limited Service for Illinois Valley Cities

Through limited service of eight cars daily between Chicago and La Salle, Ill., and intermediate points was started on May 15 by the Chicago & Joliet Electric Railway and Illinois Traction System upon completion of a short track connection in the city of Joliet. The new route, 90 miles long, penetrates the upper reaches of the beautiful Illinois River Valley and provides a fourth through interurban service out of Chicago.

Under an operating agreement between the two lines the Illinois Traction System now runs express cars over the Chicago & Joliet Electric Railway from the Archer Avenue terminal in Chicago to Joliet, thence over its own tracks to Morris, Ottawa and La Salle. The running time of the limited cars is approximately five hours.

Five light-weight, single-end, one-man cars have been remodeled for this service by the Illinois Traction System.

$13,000,000 for Less than a Mile of New York Subway

The city of New York has decided to construct the Nassau Street subway, which has been a point of contention between successive city administrations and the Brooklyn-Manhattan Transit Corporation and its predecessor, the Brooklyn Rapid Transit Company, practically since 1913, when the dual subway contracts were signed. John H. Delaney, chairman of the board, explained that the construction of the line was called for by the dual subway contracts and said it would be the "most expensive, extravagant and useless piece of work ever undertaken by the city." The estimated cost of the line to the city will be $13,000,000 for 4,830 ft. of subway, from the Municipal Building to the entrance of the Whitehall-Montague Street tunnel.

Officers of the company have declared that construction of the line would enable it to increase its service by at least 50 per cent, by relieving the congestion on its lines at DeKalb Avenue, Brooklyn, and by utilizing two now unused tracks on Manhattan Bridge for loop operation.

Municipalization Recommended in Los Angeles

It is the lines of the Los Angeles Railway and not those of the Pacific Electric Railway, the purchase of which is being considered by the city of Los Angeles. This was made plain in a news article in the JOURNAL for May 14, page 877, but in the editorial comment in the same issue the name of the Pacific Electric Railway was inadvertently used. The statement in the JOURNAL further added that the purchase price, according to Dr. Wilcox, should be approximately $30,000,000. This is the figure at which recommendation of purchase has been made by Dr. Wilcox, and refers to the Los Angeles Railway, not the Pacific Electric Railway. The depreciated value of the Pacific Electric Railway is approximately three times this figure.

Eight Cents for James Green in Indianapolis

A finding by the Indiana Public Service Commission has decreed an increase of 8 cents an hour for James Green, an employee of the Indianapolis Street Railway. The decision was rendered in a case in which Green applied to the commission, under the railway contract, for redress of grievances. His pay was increased from 37 to 45 cents an hour. Robert I. Todd, president of the company, said that until he received the official copy of the ruling and had time to study it he could not tell to what extent it would affect other employees.

The order discusses the company contract, conditions surrounding Green's case and its relation to the Indiana Public Service Commission as a board of arbitration. Closer adherence is suggested by the commission to the spirit of provisions of the contract by both the company and the men so that "such difficulties would not arise."

The commission's order applies only to Green. A portion of the order suggests the company re-employ these men as rapidly as vacancies occur.

Green was one of a number of men who went on a strike more than a year ago, when the employees sought an increase in pay. More recently he has been on the extra board for the company.

P.R.T. in New Offices

Executive and general offices of the Philadelphia Rapid Transit Company are now located in the Equitable Building, at the northwest corner of Broad and Locust Streets. Movement of the office equipment and records of the company from the various offices now occupied took place over the week end. The three full days, May 28, 29 and 30, for making a transfer assured against delays of any consequence.

The eleven lower floors in the Equitable Building are to be occupied by P.R.T., while the twelfth floor will accommodate the offices of Mitten Management, Inc. P.R.T. executive offices will be located on the eleventh floor, while the various departments and clerical forces will be housed on the lower floors.

The centralization of the various offices of P.R.T. and its subsidiary companies will make for greater efficiency of operation. Offices of the company located at Eighth and Dauphin Streets, 1520 Spruce Street, Tenth and Luzerne Streets, Fifty-ninth and Callowhill Streets, Liberty Building and the Land Title Building will be vacated.

The lost and found departments of P.R.T. and of the Yellow Cab will be consolidated in the new building within a few weeks. Until this move can be made the lost and found departments of the various locations will continue to operate as at present.

Chamber of Commerce Against San Francisco Extension

Unanimous indorsement of the Spring Valley, Bernal cut and War Memorial bond issues was voted on May 26 by directors of the Chamber of Commerce of San Francisco. The Municipal Railway extension issue was opposed. The bond issues come before the people at the special election on June 14. The directors of the chamber urge the three first issues as a "progress measure." On the railway issue they said:

> We regret exceedingly that the voters have not been permitted to vote separately on the different street railroad projects, so that meritorious extensions could be approved without at the same time committing the city to unbusiness-like and impractical extensions, which would be a severe drain upon its resources.

Attention is called to City Engineer O'Shaughnessy's original recommendations for extensions costing $2,850,000. The difference between that sum and the $4,700,000 bond issue to be voted upon is said to be the cost of the "unnecessary and unprofitable extensions." The statement continues:

> If the people were to defeat the propose drailway extension bond issue, the city will be able later to submit a subsequent series of bond propositions for extensions, and though resulting in delay would not be as serious as the proposed reckless waste of the people's money.

Trial of Short-Haul Five-Cent Fare in Seattle

A short-haul 5-cent fare system will be tried out by the Seattle Municipal Street Railway, Seattle, Wash., in the downtown district, if plans which D. W. Henderson, superintendent, has recommended to the City Council, with the approval of Mayor Bertha K. Landes, are authorized by that body. Mr. Henderson asks the Council for permission to try the reduced fare plan for 60 days, beginning July 1. The plan provides for a loop route, with shuttle cars furnishing the service operating on a loop system. The fare will be 5 cents without transfer privilege. Passengers requiring transfer to through lines will be required to pay the full fare, 10 cents cash or 8⅓ cents token rate. Shuttle cars will be painted a distinctive color, so they will not be mistaken for through cars, and operation of cars on through lines now running through the business district will not be discontinued.

Mr. Henderson believes the plan will increase the railway's revenues by promoting use of the street cars for short trips in the business section. The plan has been discussed thoroughly with Mayor Landes, who believes it is worth a trial. Mr. Henderson has also asked the City Council for legislation which will make possible operation of express cars on the recently rebuilt Westlake Avenue North line. He requested authority to purchase two auto buses, for use in handling purely local traffic on Westlake Avenue North.

Rates to Be Revised.—The Conestoga Traction Company has filed with the Pennsylvania Public Service Commission at Harrisburg a revision of its passenger rates which will apply to both city and suburban lines in Lancaster County. The new rates will be slightly higher to the occasional rider who pays a cash fare of 7 cents. About the same fare will be charged to semi-regular riders who buy four tickets for a quarter, and will be considerably lower to those who ride regularly and who buy a weekly pass good for an unlimited number of rides for $1.10. The cash rate now is 6 cents.

New Wage Scale in Indianapolis.—By an agreement between John P. Tretton, superintendent of the Indianapolis Street Railway, Indianapolis, Ind., and a committee of thirteen men representing railway and bus employees, a new schedule of pay, increasing wages of these men 3 cents an hour, became effective on June 1. The scale approved at the meeting is the same as that fixed in an order by the Indiana Public Service Commission. The increase applies to all of the men who operate buses or street cars. The new minimum scale is 40 cents an hour and the maximum 45 cents.

Makes Suggestions for Traffic Control.—For the regulation of traffic on Olive Street, St. Louis, Mo., when that thoroughfare is widened between Twelfth Boulevard and Channing Avenue, Reyburn Hoffmann, traffic engineer, in his annual report to Director of Streets and Sewers Brooks, has recommended that only nine street car stops be allowed on Olive Street between Grand Boulevard and Twelfth Boulevard. Mr. Hoffmann predicts that Olive Street will become the main East and West traffic artery of the city and in order that street cars and automobiles may move swiftly and safely he believes that the number of car stops should be reduced to a minimum. His arrangement would allow street cars a speed of 15 m.p.h. and automobiles 20 m.p.h., on the average. Automatic traffic signals would be synchronized.

Fare Reduction Hearing Refused.—The Public Utilities Commission of the District of Columbia refused on May 26 the request of the Public Utilities Committee of the Federation of Citizens Associations that a public hearing be held on reduction of car fares for school children, sale on cars of three tokens for 20 cents and issuance of universal transfers. It claimed that neither the Capital Traction nor the Washington Railway & Electric is earning a fair return on its investments. The commission said that a public hearing on these questions would be inappropriate in view of the restricted income of the companies, inasmuch as two of them would amount to fare reductions, which would still further reduce the companies' income. Nevertheless, the commission ruled, if a public hearing should be called on any other question affecting either of the companies in the near future, the federation's suggestion in the call would be considered.

New Pamphlet Appears.—The first issue of the *Indiana Service News* appeared under date of May, 1927. It will be published monthly by the Indiana Service Corporation, Fort Wayne, Ind., with a threefold purpose. First, the company desires that there be some channel for giving employees news which cannot be issued in bulletin form, the second desire is to have a means by which each employee may learn what the company as a whole and in its various departments is doing, and, lastly, it is thought that the publication will acquaint employees with each other, and by cultivation of friendship increase the company's success.

Recent Bus Developments

Hearing to Be Held on Indianapolis Bus Purchase

The Indiana Public Service Commission is to conduct a hearing shortly in connection with the recent proposal by the Indianapolis Street Railway, Indianapolis, Ind., to purchase the stock of the Peoples Motor Coach Company for $500,000. The original petition was refused some time ago. The petition for rehearing was supplemented by an intervening petition signed by approximately 100 residents of the city, asking the commission to hear the case again.

The petition states that the commission erred in its method of determining the value of the coach company. The new petition offers no alteration in the proposed price of $500,000, which the commission held to be too high, but points out again that savings which would result through co-ordination of operation and elimination of duplication would be $117,000 a year. To the objection of the commission that 8 per cent interest on the notes to be issued by the purchasing company to pay for the property is too high, the petition points out that even this method would save $21,000 over the alternative one of selling a lower interest bearing security at a discount.

Gary Railways Would Abandon Express Motor Coach Route

Application for authority to discontinue motor coach service over a 6-mile route on Broadway, the main business street of Gary, Ind., was made to the Indiana Public Service Commission on May 31 by the Gary Railways. In maintaining an hourly, limited-stop express service on this line between outlying residential sections and the downtown business center, the company's petition states, an average daily operating loss of $50 has been incurred since the service was started April 18. It is alleged that the number of passengers per trip has seldom exceeded ten and that the average is only 2.7. Although a luxurious type of parlor motor coach equipment has been used in this service, failure of the line to do a paying business is attributed by officials of the company to intense private automobile competition and to the fact that a more frequent service is provided over a large portion of the route at a lower fare by the company's street cars.

Bus Expansion in Westchester

The Public Service Commission granted on May 31 the petition of the New York & Stamford Railway for approval of a declaration of abandonment of portions of its line in the village of Rye and the town of Mamaroneck, Westchester County, N. Y. This petition is part of a general plan of the railway to substitute buses for railway service in parts of its territory. Trolley service in Port Chester has already been abandoned and bus service substituted and permission was given on May 31 by the commission for bus service in Mamaroneck and Larchmont. This petition is for the abandonment of service in Larchmont and Rye by railway and the substitution of bus service. A petition for a certificate for operation of buses in Rye has not been acted upon because the company and the village authorities have not agreed upon the most feasible route.

Testimony at the hearings showed that the Rye Beach line and the Larchmont Manor railway lines had not paid operating expenses for a considerable period of time, and in an effort to minimize its loss as much as possible the company has adopted the policy of substituting buses on certain portions of its trolley lines.

The company is desirous of acquiring the capital stock of the County Transportation Company, Inc., which recently was granted permission to operate bus lines in the villages of Mamaroneck and Larchmont.

New Deal Likely in Miami

Final Argument Heard on Jitney Elimination—New Contract Between City and Company Suggested—Mayor Favors Eliminating Jitneys

FURTHER continuance of the jitney bus drivers' injunction suit against the city of Miami, Fla., was ordered recently by Circuit Judge H. F. Atkinson when Bart A. Riley, counsel for the jitney owners, named the Miami Beach Railway co-defendant in the action. Counsel for the railway asked for the continuance in order to prepare its case. The final hearing will now be held on June 10 instead of May 25 as originally set.

The suit was brought several months ago to restrain the city from enforcing a new transportation ordinance that would rule small automobiles operated for public hire from the downtown streets. Charges of a conspiracy between the city and the railway were made. Circuit Judge Atkinson referred the action to H. H. Eyles, general master, for sifting of the charges. The testimony was returned to the court recently. Although the city's bus contract with the railway was attacked in the bill, the railway was not named a defendant until a few days ago.

Miami's passenger transportation ordinance was scheduled to go into effect on Feb. 3. Immediately after its passage, however, the measure was attacked in a suit brought in Circuit Court by C. H. Wood, jitney bus driver, who represents 160 other persons engaged in the jitney bus business, requesting that the court prevent the city from enforcing the act.

Besides asking for temporary and permanent injunctions against the city, the bus drivers through their bill ask that the ordinance be declared a violation of the constitution of the United States and the bill of rights of the state of Florida; that the city be further enjoined from illegally expending any of the moneys of the city for the benefit of any private corporation; that the defendants be restrained from combining and confederating together with any person, firm or corporation for the purpose of restraining the transportation of persons for hire in the city, and other relief.

The city's contract with the Miami Beach Railway, a subsidiary of the Florida Power & Light Company, is attacked in the petition and declared to be illegal. It is charged that the City Commissioners have surrendered their law-making power in the contract and have bound the city to unlawful things. According to the jitney drivers the purpose of the new bus ordinance is to break down competition between jitney drivers and the Miami Beach Railway, which operates both cars and buses, all of which have seating capacities of more than fifteen persons each. It was further charged that the city in securing passage of the measure was motivated by a contract with the Miami Beach Railway which guarantees the company a minimum income in the operation of buses.

To this the commission answered that there was an oversupply of transportation in Miami which, in addition to increasing traffic congestion, was costing the taxpayers a considerable amount that could be materially reduced or eliminated entirely under a new system. The commission conceded, however, that the ordinance would work a hardship on present jitney operators and expressed a willingness to minimize this as far as the public interest would allow.

In this connection the Mayor said that for some time he had been in favor of an ordinance to prevent operation of jitneys, but denied that a conspiracy existed, or that the city authorized money for purchase by the railway of jitney bus drivers' rights. In referring to the railway's practice in buying up the rights, the chief executive said:

> I though they should give the jitney owners something. They didn't have to do it. I was glad to see it done because these boys had some investment and had suffered losses. There is too much traffic congestion downtown.

According to him, adequate transportation was the greatest need of the city when the contract was entered into with the railway. He told how transportation increased property values by making outlying sections accessible. This, he said, the railway was doing by operating buses in territory that was not as renumerative as other sections of the city.

Ever since the municipal bus service started more than a year ago, two problems have been involved in Miami's transportation situation. One was the demand of thousands of home owners and citizens that adequate and dependable transportation be furnished in all sections of the city at reasonable rates.

The other was that if such service was furnished its cost would probably be reflected in taxes.

The Miami Beach Railway is understood to have agreed to meet the City Commission half way or more on any reasonable proposal with respect to the modification of the operating arrangement between them, even to the probable extent of canceling its present charge against the city and trusting to the future prosperity and population of the city to overcome the deficit.

Under tentative plans the railway would continue to operate buses, but in a competitive field and without any guarantee against losses. The company also is under contract to operate the railway system in Miami on terms which prohibit it from charging more than a 5-cent fare. In return for the minimum fare guarantee the city leases its railway equipment to the company on a sliding rental scale, $3,500 for the year 1927, $4,500 for 1928 and $5,500 for 1929. The company maintains the transit lines and equipment, but the city is found to furnish new cars as needed.

A portion of the plan under consideration is an arrangement whereby the city would waive its annual lease charges and in turn be released from the purchase of new cars. The company would then link its railway and bus transportation into a unified system, maintaining both, furnishing all replacements and operating on a virtually independent basis. At present both the railway system and the bus service are operating at a loss, the records show.

Buses Not Sources of Revenue on Lincoln Interurban

Supporting his request for permission to abandon three buses as supplementary to his cars, J. M. Bramlette, general manager of the Omaha, Lincoln & Beatrice Railway, testified before the State Railway Commission that his experience with buses had been disastrous. The company put the buses in service on Oct. 19, 1926. The operating expenses per bus-mile up to May 1 were 20.12 cents, while the gross revenue was 18.27 cents, a loss of 1.85 cents. As drivers' wages were increased 5 cents an hour on May 1 the deficit was increasing, with the slack period approaching. Gross revenue for the period was $14,590, while operating expenses were $16,065.

Mr. Bramlette testified that the cost per bus-mile was favorably affected by the fact that he was general superintendent and general foreman as well as general manager. As a substitute for part of the bus service, which was largely competitive with the company's cars, he would speed up service between Lincoln and University Place during peak hours and would give through service instead of shuttle service run before the buses were installed.

The company desires to abandon Fourteenth and O Streets, Lincoln, its downtown terminus for many years, and to run its cars largely on the rails of the Lincoln Traction Company around a loop that keeps it off the main business street, but touches the shopping, hotel and theater districts.

Financial and Corporate

Control of Washington-Baltimore Road in New Hands

Application to take over the controlling interest, or 54 per cent of the stock, of the Washington, Baltimore & Annapolis Railroad through the medium of a holding company has been made to the Maryland Public Service Commission by the Consolidated Gas, Electric Light & Power Company, Baltimore. The commission has set June 3 as the date to hold a hearing on the application.

The petition filed with the Public Service Commission states that the shares the Consolidated plans to take over are held by Aldred & Company, New York bankers, who are prepared to sell at $1,135,802 cash.

Charles Markell, attorney representing the Consolidated, filed the petition with the commission. The holding company, known as the Baltimore Corporation of Maryland, filed a certificate of incorporation with the State Tax Commission shortly before the application was made to the Public Service Commission. The directors of the holding company will be members of the board of the Consolidated, which includes Herbert A. Wagner, Charles M. Cohn, Charles E. F. Clarke, John L. Bailey and F. W. Wood.

Under the terms of the plan submitted to the Public Service Commission the holding company would issue 45,433 shares of capital stock without par value, to be acquired later by the Consolidated for $1,135,825. Approval also is asked for the acquisition by the holding company of 18,148 shares of Washington, Baltimore & Annapolis preferred stock and 32,429 shares of common stock.

If the Consolidated obtains control of the railway it also will, at the same time, acquire the subsidiary companies operated by the electric railroad. These are the Annapolis & Chesapeake Bay Power Company, which serves a large territory between Baltimore and Washington; the Terminal Real Estate Company and the Maryland Development & Realty Company of Anne Arundel County.

The total mileage operated in 1926 by the railway was 147, with total car-miles of 4,479,856. Operating revenue, including the subsidiaries, totaled $2,564,047.29.

New Charter Sought for Old Cincinnati Line

The first step toward taking over the old Cincinnati, Georgetown & Portsmouth Railroad was made recently when the Cincinnati, Georgetown & Portsmouth Railroad applied for a charter at Columbus, Ohio. The road recently was sold at receiver's sale under direction of the Common Pleas Court and was bid in by J. P. Longon at $225,000. Capital of the new concern consists of 500 shares of no par value stock. The Cincinnati, Georgetown & Portsmouth is a 42-mile interurban connecting Cincinnati with Georgetown, Ohio. Indications are that operation will continue under control of new owners.

Reduction in Corporation Income Tax Urged

A specific demand for the reduction of the corporation income tax, backed by the business interests represented in the 1,500 member organizations of the Chamber of Commerce of the United States, will be made upon the new Congress when it assembles next December. This move was decided upon at a meeting of the special committee on taxation of the chamber, meeting in Washington.

A reduction of the corporation income tax rate to 10 per cent from the 13½ per cent rate now in force will constitute the main item on the business program for tax revision. Such a reduction, it was asserted, should be made even if it were to involve a deficit at the end of the fiscal year, on the ground that the imposition of so heavy a burden upon productive enterprise is wrong in principle and retards the economic development of the country.

According to the present outlook, the committee believes a lowering of the rate will not lead to a shortage in the government's income. It is expected that the Treasury's books on June 30 will show a surplus of $450,000,000, while the 3½ per cent reduction in the corporation income tax would amount to approximately $325,000,000, leaving a margin of $125,000,000 for reductions in other directions, such as the repeal of the federal estate tax and the war excise taxes on particular business.

Earnings in Tennessee Increase

The gross earnings of the Tennessee Electric Power Company, Chattanooga, Tenn., for the year ended Dec. 31, 1926, included transportation earnings of $3,284,487, against $3,258,165 for the year previous. This figure includes operations by the Nashville Railway & Light Company and other subsidiaries of the Tennessee Electric Power. The annual report to the stockholders states that approximately 27 per cent of the gross earnings was derived from the transportation business. During the year the transportation systems in Nashville and Chattanooga carried 45,615,025 passengers, a gain of 125,034 passengers over 1925. Comparative figures showing the revenue passengers carried during the past five years are as follows:

1922	45,680,057
1923	45,929,865
1924	45,057,283
1925	45,489,991
1926	45,615,025

In order to improve service to the public, the company and its subsidiaries expended $7,385,889 in 1926. Of this amount approximately 12 per cent was used in the transportation department. This included the purchase of 20 modern light-weight, double-truck, one-man, two-man operated rail coaches, of which ten were placed in operation on the Nashville and ten on the Chattanooga city transportation systems.

During the year the capital structure of the company was simplified and additional money received through issue of common stock, practically all of which was purchased by the Commonwealth Power Corporation. The company sold during the year a net total of $1,770,100, par value, of first preferred stock on the customer-ownership plan. At the close of 1926 the total amount of preferred stock subscribed on the monthly payment plan was $897,000, par value, on which $608,350 remained to be paid in 1927 by the subscribers.

New Jersey Subsidiaries Report Gain

Public Service Rail and Bus Passengers Show Increase of 34,000,000—Maintenance Work Continues—Progress Noted in Co-ordinated Rail and Bus Service

OPERATING revenues of subsidiary companies of the Public Service Corporation of New Jersey for the twelve months ended Dec. 31, 1926, were $106,303,209, against $94,715,525 for the year previous. This was disclosed in the eighteenth annual report, which shows a net increase in surplus of $2,666,318 after payment of dividends of $6,067,033 on the common stock of the Public Service Corporation of New Jersey. For each of the quarters ended March, June and September $1.25 per share was paid on the common stock. An exchange of the common stock on the basis of three shares for each share outstanding was made during October, and for the quarter ended Dec. 31, 1926, a dividend of 50 cents a share was paid.

Readers of the ELECTRIC RAILWAY JOURNAL, though interested in all operations of the New Jersey system, are especially concerned with the transportation properties, which serve 188 municipalities housing 2,493,564 people. Thus the figures in the accompanying tables reflect primarily activities in the bus and railway fields.

NEARLY 600,000,000 PASSENGERS TRANSPORTED

The number of passengers carried on Public Service cars and buses in 1926 was 597,330,872, exceeding by more than 34,400,000 the number carried in 1925. This increase reflects to some extent business added through purchase of additional lines and buses before operated by independent owners, but at the same time demonstrates a satisfactory increase in riding throughout the territory served. Progress is reported in the co-ordination of street car and bus service, and the result shows in the more favorable financial statements of Public Service Railway and the Public Service Transportation Company. The task is, however, by no means complete and can be fully accomplished only by greater co-operation from state and municipal authorities than has yet been extended. The complete situation as it affects the public and the companies was put before the State Board of Public Utility Commissioners in a petition filed with the board on Dec. 14, in which specific suggestions for relief were made.

On Sept. 13 a wage agreement between both car and bus employees, members of the Amalgamated Association. was signed, which, with some slight modification, keeps in force for a period of three years from Oct. 1, 1926, the rate of wages and working conditions that had been in effect since Oct. 1, 1923.

STATEMENT OF MILEAGE OF THE PUBLIC SERVICE RAILWAY AS OF DEC. 31, 1926

			Miles
First main track			536.122
Second main track and turnouts			296.287
Connections, crossovers, wyes and loops			12.090
Carhouse and yard tracks			46.186
Total			890.685
Total number of passenger cars available for operation:	Closed—1,854	Open—277	
Number of new passenger cars since 1903:	Closed—1,493	Open—327	
			Miles
Track reconstructed with new rail during 1926			13.395
Track reconstructed with same rail during 1926			1.631
Extensions built during 1926			2.173

On Dec. 3, 1926, a "no accident bonus system" was made effective for car and bus operators, under the terms of which each operator receives $1 for each week in which his accident record is clear and a total of $60 for a 52-week clear accident record.

The report states the property of Public Service Railway has been well maintained during the year and a number of improvements made for the betterment of service. The most notable of these was the extension of track in Washington Street, Newark. In connection with the Washington Street track extension, a passageway was opened along the subway, between Washington and Halsey Streets, to give access to west-bound cars having their terminus in Public Service Terminal and a station was constructed in the subway for east-bound passengers, which gives access through the Kresge department store building to the west side of Broad Street.

More than 13 miles of track was reconstructed with new rail during the year and 1.63 miles with old rail. Track extensions of 2.17 miles were made.

A total of 693 cars were completely overhauled, 1,541 received general repairs, 858 were painted, 30 additional cars were converted for one-man operation and snow scrapers were installed on 349 cars.

The scope of Public Service Transportation Company's operations was materially enlarged during the year by the taking over of independent lines and buses and by the starting of new lines. In addition to the purchase of individual buses on a number of lines, the company took over entirely on May 3 the Arrow bus line, operating between Newark and Paterson, and on May 7 the Peters bus line, operating between Elizabeth and Rahway. On Jan. 15 the River Road line of buses was put in service between George Road and the Edgewater-Fort Lee boundary line. On Jan. 24 the High Street line was put in operation between Bloomfield Avenue and High Street and the Produce Market, Newark. On April 26 the Bergen bus line was put in operation between Hackensack and the Weehawken ferry and on Dec. 27 the Edgewater line was put in operation between Ridgefield and Edgewater.

Bus equipment of the company was greatly improved during the year. After careful investigation of various types, 395 gas-electric buses were purchased and substituted for unsatisfactory equipment taken over, or put into service on new lines. Bodies for 189 of these buses were built in Public Service shops.

A large amount of construction and

* Mile zone system in effect from Sept. 14 to Dec. 7.

repair work on equipment was also done by the company. Two hundred and seventy-six buses were completely overhauled, 1,248 partially overhauled, 389 new bus bodies painted, in addition to the repainting of 366, and 652 gas engines, in addition to those in overhauled buses, were rehabilitated. Besides substantial additions were made to the garage and terminal equipment of the company.

In the matter of rates the report states that on Dec. 14, 1926, Public Service Railway and Public Service Transportation Company presented to the board a joint petition for relief, in which the financial and operating conditions of the two companies were set forth and a number of suggestions made for public co-operation in the adoption of measures which would either increase the revenue or decrease the expenses of the companies sufficiently to obviate the necessity of a general increase in rates. The changes in rates were to be effective on Jan. 1, 1927, but the Utility Board suspended them for three months and set them down for hearing on Jan. 19, 1927.

INCOME ACCOUNT OF THE PUBLIC SERVICE RAILWAY AND SUBSIDIARIES FOR THE TWELVE MONTHS ENDED DEC. 31, 1926

	Public Service Railway	Public Service Transportation Company	Public Service Railroad	Other Affiliated Companies	Total

1921	27,404,867	1926	33,062,600

* Change in classification of accounts effective Jan. 1.

Foreclosure Sale in St. Louis Deferred Until Aug. 1

The absence of a qualified bidder for the properties of the United Railways, St. Louis, Mo., has resulted in a postponement of the foreclosure sale until Aug. 1, according to an announcement of Special Master William L. Igoe. The postponement was anticipated because of the failure of the city administration and the St. Louis Public Service Company to agree on a new franchise and also because of the pending proceeding before the Missouri Public Service Commission on the application of Receiver Rolla Wells for an 8-cent fare. The St. Louis Public Service Company has practically completed its financial structure for the purchase and operation of the system, but will probably await the disposition of the franchise and the fare questions before bidding in the properties.

Easements Case Put Over.—The Maryland Public Service Commission has postponed the hearing on the easements valuation case of the United Railways & Electric Company, Baltimore. The case was scheduled to be heard on May 26, but was postponed because of the inability of one of the legal representatives of the United to attend. The date for the heaving has not been set.

Texas Acquisition Rumored.—It is reported that the Eastern Texas Electric Company, a Stone & Webster property, operating in Beaumont, Tex., is to take over the Port Arthur Traction Company, provided the franchise situation is worked out satisfactorily. The Port Arthur Traction Company operates 7 miles of line in Port Arthur, Tex.

Amends Part of Receivership Decree.—In order to correct an error, Federal Judge Faris of St. Louis, Mo., on May 26 modified his decree in the United Railways receivership case so that interest on claims should not be paid for the period after the institution of the receivership suit in 1919. The original decree provided for the payment of interest to 1926. The error was caused by the attorneys overlooking numerous court decisions which held that interest on claims stopped with the appointment of receivers.

Would Abandon Tracks and Sell Certain Properties.—The Pacific Electric Railway has applied to the California Railroad Commission for authority to abandon and remove its tracks on Third Street and Broadway in the city of Santa Monica, and also for authority to sell certain property along its Huntington Beach Line in the city of Huntington Beach.

Objects to Track Removal.—A number of the city officials and citizens of Watertown, Wis., appeared before the Railroad Commission to protest against the abandonment of railway service in Watertown. The City Council has granted the Milwaukee Electric Railway & Light Company permission to remove tracks in connection with the company's $100,000 rapid transit improvement program, which includes provision for local service over interurban lines only. The commission took the case under advisement.

Would Abandon Part of Line.—Application was made to the Public Service Commission on May 20 by the Geneva, Seneca Falls & Auburn Railroad, Inc., and L. S. Hoskins and James M. Ryan, as receivers, for approval of a declaration of abandonment of part of its line in Seneca Falls, N. Y. The company alleges that this part of its line is no longer necessary or convenient to the public.

Defunct Line Bought.—Eleven miles of steel rails and other track equipment of the Murphysboro & Southern Illinois Electric Railroad were bought at receiver's sale recently by the Sonken-Galamba Corporation, Kansas City, which will sell the material as scrap. The line was built during the war at a cost of $300,000 and operated between Murphysboro and Carbondale, Ill. In later years a hard-surfaced highway paralleling the railway brought about a reduction in the passenger business until the road eventually went into receivership.

Abandonment Case Reheard.—Rehearing of the application of the Niles-Mineral Ridge branch of the West End Traction Company, Columbus, Ohio, to suspend operations was completed before the State Public Utilities Commission on May 23. The commission will conduct a further examination before making any decision. The Trumbull County Commissioners agree to withdraw an assessment of $60,000 against the company for use of a viaduct. It was this assessment which was advanced by the company as a reason for wishing to cease operations. Paul Z. Hodge, City Solicitor of Niles, and William McLain, Warren, Assistant County Prosecutor of Trumbull County, were strong in their advocacy of the continuation of service.

Would Purchase Leased Line.—The Capital Traction Company, Washington, D. C., informed the Public Utilities Commission of the District of Columbia on May 25 that it had entered into a contract with Charles Selden, owner of the capital stock of the Washington & Maryland Railroad, for purchase of the company for $98,000. This is contingent on the approval of the commission and of the Public Service Commission of Maryland. The line about to be purchased runs from Fourteenth and Kennedy Streets, N. W., to Takoma Park, Md. It has been operated by the Capital Traction Company under lease for many years. It is proposed by the Capital Traction, after buying the line, to run cars only to Third and Kennedy Streets, N. W., and from that point operate buses to Takoma Park.

Legal Notes

CALIFORNIA—*Last Clear Chance Doctrine Not Considered Applicable.*

In a pedestrian's personal injury action against a street car company, last clear chance doctrine is inapplicable, if motorman did not see the plaintiff, since such doctrine is based on the fact that defendant, knowing of plaintiff's danger, had opportunity to avoid the accident. In determining the speed of an electric train, in a personal injury action, the jury could consider the fact that the noise and rumble of a three-car train would accentuate the idea of speed entertained by many people, and that their testimony might not be so reliable as that of the motorman, notwithstanding that the latter might be classed as an interested witness. [Tolkover vs. Pacific Elec. Ry., 254 Pac., 926.]

ILLINOIS—*Defines City's Part in Relocation of Tracks of Street Railway.*

In proceedings to require street railways to remove tracks to center of street, where street was to be widened on one side, because widening and track removal were necessary for public convenience, the fact that commissioner, under ordinance, had approved old location of tracks did not estop city to require that tracks be relocated. This is the ruling since the ordinance provided that nothing therein should be construed to deprive the city of police power. [People vs. Chicago City Ry., 155 N. E., 783.]

KANSAS—*Negligence of Driver of Auto Blamed for Collision with Street Car.*

A street car was struck by an auto in which plaintiff was a passenger, at a point 4 or 5 ft. from the rear end. The testimony of the driver of the auto was that he was driving in low gear at not more than 10 miles an hour and could have stopped his machine in 6 ft. The trolley car was 35 ft. long. The driver of the auto saw the street car before the collision and had observed its movement. In view of the above, it was held that the company could not be held liable and that the driver of the auto was clearly negligent. [Mallory vs. Fleming, 253 Pac., 1090.]

MARYLAND—*Only at Certain Times Does Accumulation of Snow and Ice on Steps Mean Negligence.*

Plaintiff was injured while alighting from an electric interurban train. She claimed that the accumulation of snow and ice on the steps had made them slippery, causing her to fall; that the carrier at times cut off the snow and ice from the steps before the passengers were discharged, but that it did not do so on the occasion in question. It was held that it is unquestionably the general rule that to require a railroad operating its trains through a storm to keep its platforms and approaches free at all times from ice and snow would impose upon it an unreasonable and impracticable burden, which would seriously interfere with the adequate and efficient discharge of its duty as a common carrier; but that it is also true that when the carrier has a reasonable opportunity to discover and correct unsafe conditions caused by the deposit of ice and snow on the steps, platforms and other approaches to its cars, and fails to do so, it is negligent. [Washington, Baltimore & Annapolis Elec. R. Co. vs. Fitch, 136 Atl., 529.]

MASSACHUSETTS.—*Responsibility for Injuries Sustained by Passenger Discharged at Irregular Stopping Place.*

Decedent was discharged from a street car at an irregular stopping place, in a parkway, where snow was packed near the tracks. He crossed over the outbound tracks and was walking on the inbound tracks when he was struck by a car traveling on those tracks. The operator of the outbound car and two others testified that they looked and saw no inbound car approaching. The court held that decedent was not a trespasser as to the railway and it was presumed that he exercised due care; that in view of the above testimony a jury question was presented as to his contributory negligence. [Poppell vs. Boston El. Ry., 155 N.E., 267.]

MISSOURI—*Duty of Person Approaching Tracks Defined.*

A person nearing street railway tracks is in duty bound to listen and look in both directions for cars, providing looking or listening would enable him to discover their approach, and failure to do so is contributory negligence. [Hoodenpyle vs. Wells, 291 S. W., 520.]

NEW JERSEY.—*An Injunction Granted Against Objectionable Parking.*

An injunction was allowed a tenant of a property against a bus owner who parked his buses in the street in front of the leased premises and whose drivers molested complainant's customers and whose starters drove complainant's customers away, causing loss of business, customers and profits. [Livingston vs. Stoddard, 136 Atl., 205.]

NEW JERSEY—*Evidence of Intoxication in Collision Admitted.*

In an action by an auto passenger against a street railway for injuries received in a collision between the auto and a trolley car, evidence as to whether the plaintiff and the owner of the auto were drunk at the time of the accident was held admissible. [Damchuk vs. Public Service Ry., 136 Atl., 604.]

NEW YORK—*Rules on Operating on Routes of Other Companies.*

Use by a street railway corporation of another's route, whether as coadventurer, principal or licensee, necessarily involved agreement between corporations for use or operation by one of franchises of other, is prohibited by public service commission law. [Berkey vs. Third Avenue Ry., 155 N. E., 914-88.]

OHIO—*When Good Will of Business Is Credited.*

A certificate of convenience and necessity to operate a motor bus line over a portion of the public highways is neither property nor a business, and good will does not attach thereto; nor does operation over the public highway under such certificate entitle the holder thereof to credit his capital assets with any sum for good will or going concern. [Penn. R.R. Co. vs. P. U. Comm. of Ohio, 155 N. E., 695.]

RHODE ISLAND—*Convenience Necessity Is Determined by Commission.*

In passing upon public convenience and necessity, the commission must consider whether a proposed route is suited to and tends to promote the accommodation of the public and also whether it is reasonably required to meet a need for such accommodation. It is justified in considering the existing means of transportation as to its substantial character and its probable permanence, also the investment of capital made by the owners of such existing means, the nature of the service that is being rendered, and, if such service is adequate, what will be the probable effect of meeting competition into a field now adequately served, and what effect such competition will probably have upon the receipts of existing lines of transportation, and as to whether, in the face of further competition, the adequacy of the existing service will be continued. In this case the findings of the commission that the service of the electric trolley and steam railways was sufficient were affirmed. [Abbott vs. P. U. Comm., 136 Atl., 490. See also Columbus Ry., Power & Light Co., vs. P. U. Comm. of Ohio, 155 N. E., 647.]

TEXAS—*Adult Standee Near Track Needs No Warning of Car Rounding Curve.*

Plaintiff alighted from a street car and stood near the tracks, where she was struck by the car as it swung around a curve. It was held that after she alighted from the car and was standing on the pavement she was no longer a passenger and the company did not then owe her the duty of carrier and passenger; that the motorman may assume that an adult person, standing near the track, apparently able to see, hear and move, and having notice of the approach of the car and the existence of the curve, will avoid being struck as the car swings around the curve, and has no legal duty to warn such person of possible danger because of the swing. [El Paso Electric Co. vs. Ludlow, 291 S. W., 619.]

WASHINGTON—*Surrender of Franchise—Return of Deposit.*

In the case of a city purchasing a street railway under an ordinance, it was held that the city was not entitled to the emergency fund deposited under franchise, where the sale constituted the surrender of franchise, since the purpose of the deposit having ceased, the fund became a chose in action, to which city had no defense under the exception which applied to personal property. [Puget Sound Power & Light Co. vs. City of Seattle, 253 Pac., 1083.]

Personal Items

Cincinnati Car Company Officials

Reviews of Careers of Men Changed in Status Following Death of W. Kesley Schoepf

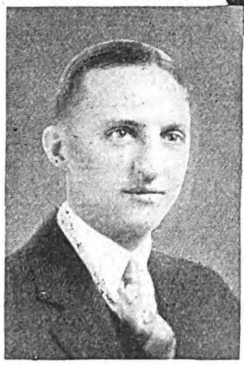
Henry L. Sanders, former vice-president of the Cincinnati Car Company and now president of that company, worked side by side with W. Kesley Schoepf up to the day of the untimely death of that powerful and successful leader. He began his association with the Schoepf companies in 1905, as assistant purchasing agent. Mr. Sanders' education did not include college training. He entered the transportation field in 1893, in the accounting department of the Atlantic Coast Line Railway. When the Spanish-American war broke out he left this position to serve his country in the navy. He was made a pay clerk and was given charge of the purchasing in the Port Royal naval yard.

This experience in accounting and purchasing fitted him for his appointment to assistant purchasing agent for the Cincinnati companies under Mr. Schoepf's control, viz., the Cincinnati Car Company, Cincinnati Traction Company and the Ohio Traction Company. In 1910 he was made treasurer of these three companies, a few years later their auditor, and from 1921 until the reorganization of the Cincinnati traction companies in November, 1925, he served as vice-president in charge of all accounting and financing. When Mr. Schoepf relinquished his connection with the railways in Cincinnati Mr. Sanders was made vice-president of the Cincinnati Car Company and served with it in that capacity up to the time of his election as president.

Ability to pick the most capable men and to hold their confidence and respect has been one of the factors in his success. When a problem presented itself he was never satisfied with anything but an expert's solution. In his own work he has always been very accurate and thorough. He gained his complete knowledge of the industry through his ever-present desire to get to the bottom of things.

A. L. Kasemeier, re-elected vice-president in charge of sales, also has a fine record in the Schoepf companies. His official positions were auditor, treasurer and later assistant general manager of the Cincinnati Car Company. In 1924 he was elected vice-president in charge of sales, in which position he will continue to serve this company.

J. Howard Elliott, elected vice-president in charge of production and purchases, had served the car company as general manager in charge of production for the past few years. Mr. Elliott joined the Cincinnati Traction Company in 1907 as an engineer and draftsman, after completing his education at the University of Cincinnati. He was transferred to the car company in 1917 as assistant superintendent of the shops. His father, Thomas Elliott, was formerly vice-president and general manager of the car company, but is now president of the Continental Cotton Gin Company, Birmingham, Ala. Thomas Elliott, however, continues to serve the company in a consulting capacity on problems of engineering and design.



E. C. Bernhold

J. H. Elliott

A. L. Kasemeier

In oval—H. L. Sanders

The office of treasurer was assigned to E. C. Bernhold, who was formerly secretary. He will continue his duties as secretary, combining that office with treasurer. Mr. Bernhold's record with the company is an enviable one. His work came to the attention of Mr. Sanders shortly after he started with the Cincinnati Traction Company in the accounting department. The only interruption in Mr. Bernhold's connection with the car company since 1906 was during the World War, when he joined the Machine Gun Battalion as a private and later served as second lieutenant in action in France. In 1925 he was elected secretary of the car company.

Among the other officials whom Mr. Sanders has retained in his employ are Charles J. Ellis, who will be chief engineer and assistant to the vice-president in charge of production, and Dave M. Ritchie, who will be sales engineer and assistant to the vice-president in charge of sales. Mr. Ellis has been with the company since 1912 and Mr. Ritchie since 1913. S. E. Reith will continue as assistant secretary and assistant treasurer.

On this solid foundation of competent assistants Mr. Sanders will continue to build his organization and to keep it in the front ranks of car builders. In an interview, he was loath to make any prophecies, but he did say:

> We plan to continue operation with the same personnel and with the same program of building cars that are safe and that meet the public's demand for comfort. We will continue to take into our organization men of the caliber of those now serving us. We believe in the co-operative plan of education which is followed by the University of Cincinnati in its College of Commerce and Engineering. Many of these co-operative students are in our employ and we are getting only the most gratifying results.

G. B. Cortelyou Chairman Joint Utility Committee

George B. Cortelyou, president of the Consolidated Gas Company, New York, has been elected chairman of the joint committee of National Utility Associations, representing the gas, electric and street railway industries of the United States. Philip H. Gadsden, vice-president of the United Gas Improvement Company, Philadelphia, has been elected vice-chairman of the committee proper and chairman of the executive committee. Stephen Davis, formerly judge of the Supreme Court of New Mexico and solicitor of the Department of Commerce, has been appointed counsel of the committee. The Joint Committee of National Utility Associations was organized soon after the war ended. It succeeded the National Committee on Public Utility Conditions, which was organized during the war to meet the new and complex problems thrust upon the utility industry by the war. That committee, composed of P. H. Gadsden as chairman; E. K. Hall and H. H. Crowell, not only rendered very effective service to the public, but enabled the industry to co-operate with the government in all matters looking to the prosecution of the war.

It was in recognition of the great value of co-ordinated effort in all matters affecting the industry as a whole that the joint committee was formed on the discharge of the national committee at the close of the war. The joint committee is representative of the American Gas Association, the National Electric Light Association and the American Electric Railway Association.

Harry Reid's Accomplishments Reviewed at Dinner

Harry Reid, president of the National Electric Power Company, was the guest of honor at a dinner given at the Engineers Club in New York on June 2, as a token of recognition and esteem by his friends in the utility industry. The occasion was to welcome him to the fast-growing ranks of utility executives who have been brought to the country's financial center through their accomplishments in the far-flung field of the industry. Many out-of-town friends came to join in the testimonial of good will. J. N. Shannahan, past-president of the American Electric Railway Association, presided. Speakers included B. C. Cobb, Thomas J. Walsh, James H. McGraw, Frank W. Smith, L. S. Storrs, George Chappell and Mr. Reid.

The guest of the evening was characterized as a progressive. His record of accomplishments as president of the Interstate Public Service Company and the Kentucky Utilities Company was reviewed to illustrate the reasons for his promotion to a position of broadened responsibilities. This recognition of demonstrated ability was considered one of the foundation stones that has made for stability in the utility industry.

Harry Reid

Harry Reid came to New York City early in the current year, when he succeeded Albert Emanuel as president of the National Electric Power Company. At that time other changes were made in the personnel of the officers and directors of the company. These changes were, of course, the forerunner of the removal of Mr. Reid to New York, where he now makes his headquarters.

Mr. Reid has long been in the limelight in electric railway affairs. Three years ago he was made president of the Central Electric Railway Association. At that time he was president of the Interstate Public Service Company, operating between Indianapolis and Louisville, and also president of the Kentucky Utilities Company.

Mr. Reid entered the utility field at the age of 21 as cashier with the Fulton County Gas & Electric Company. In the course of the years he became identified with utility operation in Versailles and Lexington, Ky. It was through his efforts that the Insull interests turned their attention to that state and some time later the Kentucky Utilities Company became a part of the Insull holdings. At that time Mr. Reid was made president. Later the properties, comprised in the Interstate Public Service Company, were purchased and Mr. Reid became president of that company in 1917.

Mr. Reid's career was reviewed in detail in the ELECTRIC RAILWAY JOURNAL, issue of Feb. 2, 1924, page 198.

Managing Director Storrs Honored

Lucius S. Storrs, managing director of the American Electric Railway Association, received the honorary degree of doctor of engineering at the University of Nebraska, Lincoln, Neb., on May 28. Chancellor Avery conferred the degree upon the occasion of the commencement exercises of the university and the dedication of the new museum to be known as Morrill Hall. Mr. Storrs was graduated with the degree of A.B. from the University of Nebraska in 1890, taking the scientific course. Later the degree of A.M. was given to him by his alma mater.

Three New Vice-Presidents for General Electric

The election of three new vice-presidents and the retirement of two executives of the General Electric Company were announced by Gerard Swope, president, following a meeting of the directors on May 25. C. C. Chesney, manager of the Pittsfield works; W. R. Burrows, associate manager of the incandescent lamp department, and C. E. Eveleth, manager of the Schenectady works, were elected vice-presidents of the company, taking on responsibilities in the manufacturing department. F. C. Pratt, vice-president in charge of manufacturing, and H. F. T. Erben, assistant vice-president of the manufacturing department, have retired. The other officers of the company were re-elected at the meeting.

A. T. Bagley Heads Adjustment Department in Kansas City

Arthur T. Bagley, former superintendent of employment and records of the Kansas City Railways, Kansas City, Mo., is now active head of the new adjustment department of the Kansas City Public Service Company, which replaced the claim department on April 6. Mr. Bagley's new title is manager of the adjustment department, and he reports directly to C. L. Carr, general solicitor.

Mr. Bagley joined the organization on Jan. 1, 1921, as superintendent of personnel, and shortly thereafter was placed in charge of the employment and records department. For 13 years prior to that date he was with the Department of Justice as a special agent and later as agent in charge of the department's Kansas City office. Prior to this connection with the Department of Justice, Mr. Bagley was with the War Department on harbor improvement work and the U. S. Geological Survey.

A. J. Lundberg Also Vice-President at Oakland

Alfred J. Lundberg, whose succession to the Key System Transit Company, Oakland, Cal., was referred to in the ELECTRIC RAILWAY JOURNAL, issue of May 28, 1927, has also been elected vice-president of the company.

His first business connection was with the Bank of San Francisco, which later was absorbed by the Bank of Italy. He entered the employ of the bank in 1909 and in 1910 became an employee of the state banking department under Alden Anderson, superintendent of banks. A year later he became secretary of Herbert Fleischhacker of the Anglo and London Paris National Bank in San Francisco, remaining in that capacity until 1912.

In the latter year he accepted a clerkship in the brokerage firm of J. Barth & Company in San Francisco, becoming a partner in that concern in 1926. Associated with Mr. Lundberg in the partnership of J. Barth & Company are Gustav Epstein, Harry C. Clayburgh, Richard O. Simon and James D. McDonald. Barth & Company now represent the majority of stock in the Key System and Messrs. Epstein and Clayburgh are associated with Mr. Lundberg in the directorate of the railway.

A. J. Lundberg

Alfred J. Lundberg was born in San Francisco. He received his education in the public schools of his native city. He was the first president of the San Francisco Stock and Bond Exchange Institute and is a member of the San Francisco Commercial Club and other well-known organizations.

R. W. Garvin Directs Monongahela West Penn Publicity

Ray W. Garvin, Clarksburg, has been appointed manager of the public relations department of the Monongahela West Penn Public Service Company, Fairmont, W. Va., to succeed Major Earl H. Smith, whose resignation became effective April 1 last. In his capacity as manager of the public relations Department Mr. Garvin will have charge of all the public relations work and activities of the company of every nature and description, with general supervision of advertising and advertising expenditures.

Mr. Garvin was appointed to the Monongahela West Penn family from the editorial staff of the Clarksburg *Exponent*, with which newspaper he has been associated in several capacities over a period of years. He also has been connected with the *Telegram* in Clarksburg and the *Times* in Fairmont.

In addition to his newspaper work he has engaged in general publicity work and has also devoted some time to politics. At present he is the only Democratic member of the West Virginia House of Delegates from Harrison County, and in 1923 he was also a member of the House of Delegates, being at that time the youngest member of the Legislature.

Mr. Garvin served his apprenticeship as a printer, and is still a member of the International Typographical Union, although it is more than ten years since he worked at the trade.

Judge Joseph Coult, who has been claims attorney for the Public Service companies of New Jersey since 1922 and associated with the organization since 1913, has resigned to take up the practice of law with David Satz under the firm name of Coult & Satz. Judge Coult was admitted to the bar in 1901 and served as judge of the Court of Common Pleas of Sussex County before forming a partnership with Thomas Woodruff in Newark for public practice. He went to the Public Service Dec. 1, 1913, as trial attorney. He became claims attorney June 15, 1922.

In Memoriam

As a result of an error the name of John J. Stanley, president of the Cleveland Railway, was omitted from the list of those who answered the call of their maker in the year just closed as published in the ELECTRIC RAILWAY JOURNAL for May 28, page 980. Mr. Stanley, who died during the convention of the American Electric Railway Association in Cleveland last October, was a former president of the association. There is no need to expatiate again on the man as a character, on his ability or on the results he achieved, but the editors do desire to express to his friends and associates the deep regret they feel at the inadvertent omission of his name from the list as originally published.

Ernest Stenger Dead

Head of Denver Tramway and Former Receiver of That Property Succumbs to Pneumonia After Illness of Only Two Days

ERNEST STENGER, president of the Denver Tramway, Denver, Col., died in that city on May 28, of pneumonia. Forty-eight hours previously he was seated in his office discussing business with Vice-President Robertson.

Mr. Stenger went to the Denver Tramway as president on Sept. 29, 1920, from the Union Pacific Railroad, for which he had been superintendent of the Southern division. Subsequently he served as receiver at Denver and then as president of the successor company following the reorganization of the property.

He was a newcomer in the electric railway field when he took the post at Denver with the tramway, his previous experience having been entirely in steam railroading. Shortly after his arrival he stated that he had come to Denver to operate the tramway in such a way as best to serve the public. And that is just what he did. There were many trying experiences in connection with the conduct of the road, particularly the controversy with the city over franchise rights, but Mr. Stenger never lost sight of his announced objective. Any attempt to appraise the work of the man must take fully into account the adverse conditions under which he labored. His incumbency of the office was preceded by the period of very great increase in labor and material costs, culminating in a strike which had used up all the company's available funds. This was the heritage to which he succeeded. The prospects certainly were not rosy. Few other men would not have quailed before them, but Mr. Stenger carried through his program successfully, although his accomplishments never did approximate his dreams of what he desired the tramway to be.

When Mr. Stenger went to the tramway he had already achieved a reputation for "getting things done" as superintendent of the Southern division of the Union Pacific Railroad. At that time the office of president had been vacant since 1913, the direction of the affairs of the Denver company having been largely in the hands of Charles Boettcher, chairman of the board of directors. In addition to serving as president, Mr. Stenger performed the functions of general manager.

Like many steam railroad executives, Mr. Stenger gained much of his experience in the school of hard knocks. A civil engineer by training, he had a broad understanding of the fundamentals of the transportation industry, which not only made possible the rise to a position of responsibility with the Union Pacific, but enabled him to visualize the problems of the Denver system. He was well acquainted with the West, his entire railroad career having been passed west of the Mississippi River.

Ernest Stenger

Mr. Stenger was born in 1865 at Colmar, Alsace. Coming at an early age to the United States, he was graduated from the University of Michigan in 1886. In the same year he entered the railway service as a rodman with the Burlington & Missouri River Railroad in Nebraska. After two years of this work he was appointed a draftsman with the Atchison, Topeka & Santa Fe Railway, resigning in 1890 to become assistant engineer with the Missouri Pacific Railway.

After serving with the Missouri Pacific for ten years, Mr. Stenger resigned to join the Union Pacific System. His first position with that road was that of division engineer. He later served as assistant superintendent and as division superintendent. In 1907 he was made general superintendent of the Rio Grande Western Railway, continuing in that capacity until March, 1911. He then became general manager of the St. Joseph & Grand Island Railway, with headquarters at St. Joseph, Mo. He subsequently returned to the Union Pacific as superintendent of the Southern Division, making his headquarters at Kansas City.

During the World War he served with the American Expeditionary Forces in France as a lieutenant-colonel of the 31st Engineers. He was cited by General Pershing for efficient and capable service, and the French government conferred the Legion of Honor ribbon upon him.

Francis J. Clamer, founder of the Ajax Metal Company, Philadelphia, Pa., died recently in Collegeville. In 1868 he obtained the first practical results of anti-friction metals and raised money to start manufacturing on a large scale. Mr. Clamer was 87 years old. He was born in Hamburg, Germany, and went to Philadelphia when he was eleven years old.

Le Roy Clark, president and director of the Safety Cable Company, died on April 18 at Falmouth, Mass. He had been a prominent figure in the wire and cable industry for many years. As an electrician a year prior to his graduation from college he became connected with the predecessor of the Safety Cable Company, the Insulated Wire & Cable Company, with which he was associated during his entire business career. Later he became electrical engineer for the company and upon its reorganization in 1902 he was made vice-president. Four years later he was promoted to the presidency. Mr. Clark was a member of the American Institute of Electrical Engineers.

Manufactures and the Markets

News of and for Manufacturers—Market and Trade Conditions
A Department Open to Railways and Manufacturers
for Discussion of Manufacturing and Sales Matters

General Electric Creates Engineering Council

In conformity with the action of the board of directors of the General Electric Company, an engineering council has been appointed. The council includes E. W. Rice, Jr., honorary chairman (ex officio); E. W. Allen, chairman; Elihu Thomson, A. C. Davis, W. R. Whitney, W. L. R. Emmet, C. C. Chesney and C. E. Eveleth.

The purpose of the engineering council is to advise with the vice-president in charge of engineering on the various problems that arise from time to time and as to the direction and scope of the engineering and scientific work. The council may invite other engineers to meet with it and at such times may give them the status of regular members.

Expansion by Globe Ticket Company

The Globe Ticket Company, Philadelphia, has purchased the plant and business of the Trimount Press, Inc., Boston. The plant will be enlarged and improved to manufacture, for the New England territory, all classes of tickets and checks heretofore supplied from the main factory in Philadelphia.

The Trimount Press, Inc., has been under the management of John M. Cummings for more than twenty years. Mr. Cummings becomes a director and second vice-president of the Globe Ticket Company, in charge of the new factory and office in Boston.

Recently the Globe Ticket Company established new branch offices in Cleveland and Baltimore. It has a factory and sales office in New York and a plant at Los Angeles, which is a replica of the Philadelphia factory. The Globe company is one of the oldest of its kind in this country.

Revive Plans for Mexican Interurban Lines

Plans of the Mexican Tramways for the construction of two interurban electric railways, one to run from Mexico City to Puebla, 130 miles, and the other from the capital to Pachuca, 60 miles, have been revived. It is stated that financial provision has been made for constructing the two lines and that the work will be started as soon as the surveys are finished and given formal approval by the government authorities. The route of the interurban line that is to run to Puebla will be of unusual scenic beauty as it traverses a picturesque region situated between the volcanoes of Popocatepetl and Ixtaccihuatl.

The project of constructing this road was well advanced years ago when a long period of revolution and banditry caused it to be temporarily set aside. At that time the plans included the construction of a scenic electric and cogwheel railroad up the slopes of Popocatepetl to the summit. It was intended that this road should serve also as a transportation facility for the great sulphur deposit which the crater of the volcano contains and which has been mined on a commercial scale by primitive means from time immemorial.

The Mexican Tramways is owned by Canadian interests. It operates the system of electric railways in Mexico City and the Federal District.

Transformer Prices Reduced by General Electric

General Electric Company announces a 5 per cent reduction in prices of distribution transformers and small power transformers, effective on June 1. This reduction is the sixth since 1920. On certain types of large transformers reductions which average 5 per cent for this class of product have also been made. According to J. G. Barry, vice-president, these reductions are made possible by economies resulting from improved engineering and manufacturing methods, as well as greater quantity production.

American Ideas at Economic Conference

Germany Has Adopted Our Methods, While England, France and Italy Claim They Are Not Applicable in Europe

By EDWARD J. MEHREN
Vice-President McGraw-Hill Publishing Company, Inc.

GENEVA, May 16.

A FEATURE of the International Economic Conference is the amount of attention the United States has received. We have not, through our delegates, invited it or forced it. Europe has taken the initiative. She is keenly aware of what we have accomplished industrially and to some extent she understands our mechanism. But the English, the French, the Italians and others say that our methods are not applicable in Europe; the Germans do not say so; they are applying them.

To their generalizations, the head of the American delegation, Henry M. Robinson, replied that at least European countries could adopt our waste elimination program and, abandoning their traditional industrial secrecy, freely interchange information regarding technical methods, research, trade practices, etc. He admitted that, with unemployment large, energetic substitution of machinery for hand labor might not now be possible, but he so put the point as to indicate that mechanization was fundamental to Europe's trade and industrial recovery.

Commenting on our much-discussed industrial efficiency, several delegates denied us perfection by pointing out—and justly, too—our prodigal waste in raw materials (now happily disappearing).

Also, the Europeans believe that in America our tastes are standardized. They contend that mass production in Europe is not possible because the Europeans are individualists and demand articles that have individuality. All in all, despite their protests, it is my belief that all the protesting delegations will go home more determined than ever that, as rapidly as they can carry out the education of owners, managers and workers, American methods will be applied. Also, this thought should not be slurred over—that perhaps the expressed attitude toward American methods is political. For example, with the large unemployment in Great Britain, how could the British delegates go home and admit that they had urged mass production and the rapid mechanization of industry?

AMERICA'S FOREIGN TRADE

Commenting on the extent of American investments in Europe in recent years, W. T. Layton, editor of the *Economist*, London, asked the American delegation whether America would continue to lend freely but would not buy from Europe. He asked also whether a new equilibrium could be established in which America would buy the natural products of tropical countries on a scale large enough to enable her creditor position to be liquidated by a system of triangular trade.

Replying to Mr. Layton, Mr. Robinson pointed out that our imports of manufactured goods, which come mostly from Europe, have doubled from 1913 to 1926. Europe's own figures of her exports to the United States in 1925 from the five principal countries, Great Britain, Germany, France, Italy and Belgium, show an increase of 76 per cent, while her exports to the rest of the world had increased 24 per cent. In addition American tourists had spent $650,000,000 in Europe last year.

AMERICA BIGGEST BUYER

As to triangular trade, Mr. Robinson revealed that ten countries outside of Europe, where European capital is largely invested, and there is virtually no American capital, had sold to the United States in 1925 goods to the increased value of 362 per cent as against 1913, while other countries had increased their purchases by only 87 per cent. The United States buys from Brazil three times as much in value as Brazil buys from the United States, but Brazil buys three and three-quarters times as much from a "single European country" as that country buys from Brazil.

Another point that interests Americans—and surprises them—is the apparent deprecation by Europeans of the possibilities of the home market. Constantly, they harp on America's huge "homogeneous" home market. True, we have a population of 120,000,000, but not so highly homogeneous as the Europeans imagine. But Great Britain has about 43,000,000, France, 40,000,000 and Germany 60,000,000, surely markets not to be sneezed at. Moreover, one needs to remember that the American market is pretty well supplied; our standards of living are very high compared with those of Europe. Think, then, of the market afforded by the opportunity to raise European standards to a point somewhat nearer the American.

Also outstanding is a matter of omission rather than of commission—namely, the relative neglect of the need for securing economy in distribution. True, several speakers made passing reference to it, but the only vigorous declaration came from Frau Emmi Freundlich of the Austrian delegation. Of course, the conference's committee on agriculture appreciates the economics of distribution and is giving it a lot of attention.

Details of Baltimore Car Equipment Orders

The United Railways & Electric Company, Baltimore, purchased the following new equipment for existing cars:

276 G.E. 275-F 60-hp. motors, supplied with G.E. grade M spur gearing 15:71. These motors were used in quadruple equipments for trailer pulling service, replacing older motors.

40 Westinghouse 306-CV-4 65-hp. motors, supplied with Nuttall grade BP spur gearing 14:60. These motors were also used in quadruple equipments for pulling trailers, replacing older motors.

69 car sets of G.E. auxiliary contactors, including DB 986 line breakers, No. 1518-A1 relays and LB-2 controller handles.

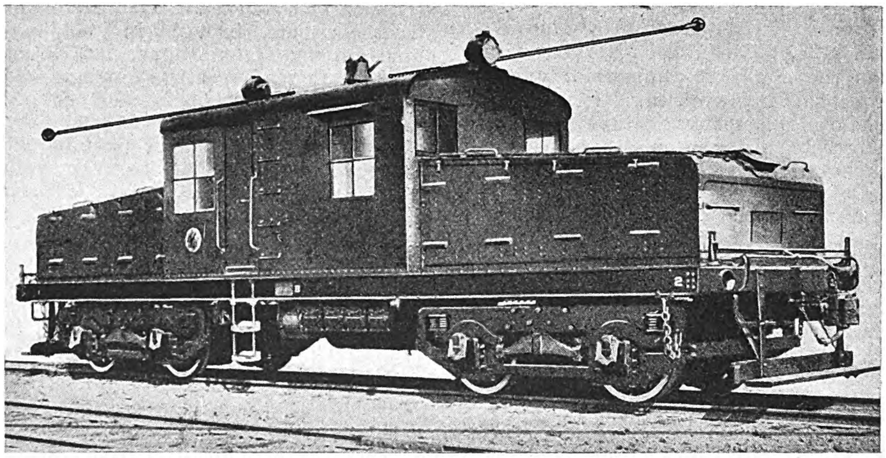
Ten car sets of Westinghouse 806-J-4 line breakers.

40 car sets of rheostatic electric car heating units. These units were of special design, patented by the Baltimore company and utilizing General Electric industrial heating elements.

250 car sets of G.E. three-cell aluminum lightning arresters.

At the present time the company is making plans to equip ten additional cars for train service, which will involve the purchase of twenty Tomlinson car and air couplers with five-point electrical couplers and other miscellaneous door contact and communicating signal equipment.

North Shore Orders Two Trolley Storage-Battery Engines



Orders for two electric trolley storage-battery locomotives have been placed by the Chicago, North Shore & Milwaukee Railroad—the North Shore Line. They are to be used in supplying freight service to the various industrial plants along the road.

The locomotives, each weighing 65 tons, will operate either from an overhead trolley or from the storage batteries, which can be charged from the trolley while the locomotives are operating. This flexibility of operation will enable the railroad to switch cars into industrial plants equipped with tracks but without trolley connections. The complete absence of smoke, noise or noxious gases of any kind will permit the locomotives to run into buildings where a steam locomotive would be very objectionable. Each unit is equipped with four motors of 205 hp. and a battery of 192 cells, rated 600 amp.-hr., capable of delivering 260 kw.-hr. on one charge.

Operating on the battery alone one locomotive will be capable of hauling 33 loaded freight cars a distance of 5¼ miles at a speed of 12 m.p.h. on one charge. With a light load the locomotive will run on the battery at a speed of 20 m.p.h.

The locomotives are being built by the General Electric Company to order from specifications drawn up by engineers of the North Shore Line, and the General Electric Company has promised delivery in about three months. They will be used largely on the new Skokie Valley route of the North Shore Line, where many industrial plants are being located.

Electric Railroad Locomotive Shipments for April

April shipments of electric railroad locomotives from principal manufacturing plants, based on reports received by the Department of Commerce, totaled 23 locomotives, as compared with 11 in March and 28 in April, 1926. The accompanying table gives the shipments and unfilled orders of locomotives for each month since January, 1926.

A $126,662 Scrap Pile in Toronto

Scrap materials were sold by the Toronto Transportation Commission for $126,662 in 1926. Nothing which has the slightest commercial value is wasted or thrown away. For example, lead foil from electric tape and wrappings, etc., brought more than $500. All burnt-out and broken electric light bulbs are saved, and the butt, being constructed of brass, is salable. These butts last year sold for more than $40.

Babbitt metal for axle bearings, when worn down, is melted and used again. There is, however, a form of slag which lies on top and cannot be used in a good bearing. This is sold as scrap, and last year more than $480 was received from this waste metal.

Aluminum cuttings from the construction of coach bodies, stanchions of street cars, etc., brought in $141, machine cuttings from copper and brass articles manufactured in the shops sold for $1,369, scrap brass and copper parts sold for more than $11,000.

The balance and larger part of the $126,000 is made up of scrap rail, wheels, lead, etc., from dismantled batteries, malleable and cast iron, pipes, steel, rubber and old plush cushions.

All scrap metal is collected from various sections and turned into the Hillcrest stores, where it is sorted. Different kinds of metal are placed in individual bins and sold separately, as much better prices are thereby obtained.

Copper Climbs Close to 12¾ Cents

A DISTINCTLY better feeling existed in the non-ferrous metal markets June 1 than prevailed a week ago, reports *Engineering and Mining Journal*. Copper, which sagged to 12½ cents delivered in the East, has recovered sharply, and on a good volume of business approached 12¾ cents June 1, one or two sales at 12⅝ making it impossible to quote the even quarter. Zinc, likewise, has advanced from 6 cents to 6.10 cents during the week, though the market has not been active. Lead is down ten points from a week ago, but business has picked up, and the tone of the market seems good. Tin was bought in fair quantity on one or two days, and prices are somewhat firmer. Antimony, on the other hand, is easier, and the market is lethargic. Platinum continues exceptionally dull, with prices, largely nominal, somewhat lower than last week.

Only about 10,000 tons of copper changed hands at 12.50 cents on the latest movement. This includes sales at the low figure on Wednesday, Thursday, and Friday of last week. On each day there was sufficient business at 12⅝ cents in the East and 12¾ cents in the West to keep the quotation above 12½. On Friday most of the 12.50 cent metal had disappeared and 12⅝ cents represented the bulk of the sales. On Saturday and Tuesday, Monday being a holiday, business continued good at 12⅝ cents.

Last Thursday lead prices declined a further ten points, in both the New York and the St. Louis markets, following a 5s. decline in London. On that day, May 26, the American Smelting & Refining Company reduced its contract price from 6.50 to 6.40 cents, New York, and sellers in the Middle West came down from 6.15 cents, St. Louis, to 6.05 cents. Business on the whole has been somewhat better; Monday's holiday of course cut into the total, but inquiries June 1 were improved. Battery and cable makers continue to be only small factors in the market.

The tin market ruled very quiet until May 31, when there was a scramble among dealers and prices for all positions were marked up quite a bit during the day. The advance in London June 1 was much less than expected, but the New York market continued strong, and prices were again higher. Tin for delivery three months hence has averaged about 3 cents per lb. below the price of prompt Straits, early deliveries continuing exceedingly scarce. Prompt Straits in New York June 1 sold at 67½ cents, which is ¼ cent below a week ago, but ½ cent above the low during the week.

For the time being at least the zinc market has turned upward from the 6 cent level reached May 26. Output from the Joplin mines has shown progressive decline to about 10,000 tons of zinc concentrate per week. Although only 6,000 tons was sold last week, it is believed that the reason was the disinclination of sellers to accept $38 rather than the lack of demand on the part of smelters.

METAL, COAL AND MATERIAL PRICES
F. O. B. REFINING

Metals—New York	June 1, 1927
Copper, electrolytic, cents per lb	12.50

Rolling Stock

New York Central Railroad, New York City, has ordered fifteen gasoline-electric motor cars for delivery within six months. Two of the cars will operate on the Fort Wayne-Jackson branch of the Lansing division. They will replace steam trains. Each unit will be 73 ft. long.

Detroit, Monroe & Toledo Short Line Railway, Detroit, Mich., is equipping its rolling stock with individual automobile seats. Cars on other long runs will be similarly equipped, it has been announced by A. L. Drum, receiver for the properties.

Trade Notes

Graham Brothers Corporation, New York City, announces the formation of a financial organization to operate in the industrial field. Offices have been opened at 1 East 44th Street, New York City.

L. H. Gilmer Company, Tacony, Philadelphia, Pa., through its board of directors, has elected Frank B. Supplee treasurer of the company. Mr. Supplee has been with the company for twelve years, working up from a minor position.

Electric Controller & Manufacturing Company, Cleveland, Ohio, announces the appointment of the firm of J. B. McCarthy & W. P. Robinson as representatives in Canada. The offices are at 307 Reford Building, Toronto, Canada, and 808 Drummond Building, Montreal, Que., Canada. The appointment of the Petroleum Electric Company, 217 East Archer Street, Tulsa, Okla., as representative in Oklahoma and the Panhandle District of Texas also is announced.

Lincoln Electric Company, Cleveland, Ohio, announces the appointment of the Wade Engineering Company, 1855 Industrial Street, Los Angeles, Cal., as distributor of Lincoln products in California. The company maintains a branch at 69 Webster Street, Oakland, Cal., both main office and branch carrying stock of Lincoln "Linc-Weld" motors and "Stable-Arc" welders, as well as service parts. The Los Angeles branch is in charge of Henry N. Wade, who is also president of the company. Mr. Wade is a graduate of Cornell University. H. T. Lintott, also an experienced electrical engineer, has charge of the Oakland branch.

Griffin Wheel Company, Chicago, Ill., has elected A. A. Hale vice-president. He is the Eastern sales manager.

Volume 69 New York, Saturday, June 11, 1927 *Number* 24

The Bigger the "If" on the Clubhouse Door the Lower the Score

WITHOUT confidence in one's own team, victory is impossible. And in business, just as in sport, confidence and enthusiasm are essential to success. A question mark in the manager's mind is soon reflected throughout the organization.

"What is the most important need of the electric railway industry?" some one asks. Above all else it seems to be confidence in the possibilities of his own industry on the part of the railway executive.

Is such confidence justified or is the industry merely whistling to keep up its spirit? The answer is simple. The arteries of transportation are the very life streams of the community. Property values are built on transportation. The value of a piece of property for business purposes depends on the number of people who pass it daily. Those people are brought there by the community's transportation system. The transportation is not only necessary, it is vital.

Then what, if anything, is the matter with the transportation industry? Public misunderstanding? Yes. Lack of co-operation by public officials? Yes. But these conditions exist only in some cities. In many others they did exist but have been eliminated. In few instances did the public or its representatives take the initiative. It is not to be expected that they will. That is the responsibility of the railway executive. In some cases a radical change in his own point of view is necessary before real progress can be made.

Whatever the Vehicle, the Principle Remains the Same

MEN who go down to the sea in ships are rightly supposed to be a shrewd and sagacious clan. Experience has taught them to be sure whither a new course, be it one of adventurous sailing or of a change in management policy, leads before they embark on it. Hence the present widely adopted policy of replacing old ships by new ones has a significance extending far beyond the shipping industry itself.

Today the world has about 30 per cent more ships than in 1913, while the volume of world trade is estimated at about 20 per cent less than it was before the war. Yet shipbuilding continues at a good rate. This is explained by the superior efficiency and attractiveness of the new ships. It has been found that they pay for themselves.

While differences are numerous between transportation by water and transportation by rail, the principle of increasing revenue by improving equipment is the same. Today there are probably enough electric railway cars available to carry the present traffic, but many of them are woefully out of date. They are costly to operate and are poor business getters. Progressive railway men, like the shrewd ship owners, have discovered it pays to replace obsolete equipment with the best that modern science can supply. This cannot be done in a day, or a week, or a month, but the movement in this direction is steadily gaining momentum.

Study the Human Element If You Would Build for Permanency!

OWEN D. YOUNG, chairman of the board of the General Electric Company, has the rare gift of specific expression in that he saves his hearers the effort required to translate words into thought. That is the principal reason why the speech made by him on June 4, at the dedication of the new building of the Harvard Graduate School of Business Administration, has attracted so much attention. He repeated some of the things he had said before about the need for a cultural wage, but he said some other significant things which reflect the attitude of big business toward the problems before it, and show the methods used by big business in rising to meet its opportunities.

Advantage can be taken of these opportunities only as the oldest of the arts and the newest of the professions thinks in terms of human beings. It certainly is true that the area of conflict between capital and labor is gradually being reduced. Many things are being learned, and not the least important among them is that low wages for labor do not necessarily mean high profits for capital. Time and brawn alone are not factors by which the barometer of productivity can be forecast. As Mr. Young made plain, the problem today is to deal with the limits within which men may work with zest and spirit and pride of accomplishment. When zest departs, labor becomes drudgery. When exhaustion enters, labor becomes slavery.

However complete the scheme of management may be which takes these things into account, it still fails of its purpose if it does not contemplate that the employee shall share in management through participation by him in ownership. Only in that way is it to be expected that the employee will use capital truly as a tool and be interested in turning it to the highest economic advantage. The hope expressed by Mr. Young was that the day may come when the great business organizations will truly belong to the men who are giving their lives and their efforts to them, no matter in what capacity.

Some of these things sound sensational only because not all of us are as yet attuned to the ideas of the new morality in business which has for its goal that we shall dispose, once for all, of the charge that in industry organizations are autocratic and not democratic. All this is unusually significant. It is not idealism run rampant. The promulgation of the doctrine comes from a man who as the head of one of the greatest business organizations in the world has witnessed the favorable results that have followed the application of the policies he preaches.

The spread of education, with its intensification of inquisitiveness and sensitiveness, has raised men to a higher ethical plane and increased their ability to appraise things properly in the light of their long-time value, while, as has been made plain before, new discovery in pure science, every enlargement of the industrial horizon, every new material put into the hands of humanity, has renewed the demand for the highest type of business management.

The ultimate object mentioned by Mr. Young, that we shall have no hired men, is a long way off, but the time is rapidly coming when ability merely to be shrewd, if it really is ability, will no longer be the *sine qua non* of success. The demands of the times for executive talent transcend any such narrow confines. This the dedication of the new building at Harvard proves. It is important to create a business heritage, but it is much more important so to build in creating it that its perpetuity may be assured. And perpetuity can be reasonably assured only as business carries on along the far-sighted lines Mr. Young has outlined—lines that contemplate the building of men with a stake in the enterprise fitted to assume greater and ever greater responsibilities.

Encouraging News on Taxes

ENCOURAGING news has come from within the classic walls of the treasury building in Washington. As the fiscal year draws to a close, we are informed that there is certainty of another large treasury surplus and of a substantial reduction in the amount of public debt. This is considered as indicative of a further tax reduction by the next Congress.

Internal revenue collections for the first ten months of the fiscal year were about $13,500,000 larger than the amounted collected a year ago, an increase of $228,200,000 in income tax collections having been nearly offset by a decline in receipts from miscellaneous taxes. "On the first of these figures," says the *Guaranty Trust Survey* of New York, "it is estimated by Treasury officials that the surplus for the twelve months will exceed $500,000,000. The actual surplus for the year ended June 30, 1926, was $377,000,000."

It is universally accepted that the only two certain things in this life are death and taxes, likewise that relief from the latter is always a matter of conjecture. Conjecture in this case is encouraging and centers around the probable reduction in the income tax on corporations. This tax, which was increased in the last revenue law, has been criticised very freely by business men and on account of lack of harmony with the general principles of income taxation. In addition, automobile and other excise taxes are likewise unpopular and may be reduced or repealed.

In the *Survey's* general prediction is included the statement that "there appears to be a growing sentiment throughout the country in favor of drastic reform in state and local expenditure." As the JOURNAL has pointed out from time to time the necessity for some relief from the present loose policy in public expenditures, it is indeed heartening to hear that the American taxpayer is at last alive to the seriousness of the situation. No corporations have suffered more from taxes than those which have the great task of transporting millions of the country's workers to and from work, to say nothing of providing the public with a cheap and efficient means of recreation—all of which has been done with this great financial millstone retarding their progress. Consistent effort, then, should be employed to make the anti-public expenditure sentiment grow. It is a plain case of self-preservation.

One-Man Car Operation Has Had Remarkable Growth

INCREASE in the number of one-man cars in operation today over the number operated a few years ago is one of the striking changes that have occurred recently in the electric railway industry. According to the JOURNAL'S latest figures there are about 750 electric railways with 80,000 passenger cars in the United States. Of this number some 20,000 cars, or approximately 25 per cent, are arranged for one-man operation. In the total number of electric railway passenger cars, however, is included a considerable amount of rapid transit equipment, trail cars and rolling stock not in daily use. The one-man cars therefore represent a somewhat larger part—possibly as much as 40 per cent—of the number of ordinary street and interurban cars in regular service.

Proportionately more one-man cars are operated in cities of less than 500,000 population than in the twelve cities in this country that are credited by the 1920 census with a population above that figure. In these twelve largest cities there are only about 4,000 one-man cars and nearly 20,000 two-man cars. Most of the former are operated in outlying sections or at night and on Sundays. Often they are operated by two men on heavy traffic routes during the day. San Francisco is the only city in this group where no one-man cars are in service. It is noteworthy, however, that the proportion of one-man cars is much greater in some of these large cities than in others, and it does not appear that the mere size of the city is a serious obstacle to one-man operation.

In Newark, N. J., a city of more than 400,000 people, all cars are one-man operated. This is true also in Jersey City, N. J.; Worcester, Mass.; Springfield, Mass; Paterson, N. J., and Camden, N. J., cities having between 100,000 and 300,000 population. The Eastern Massachusetts Street Railway, which is second only to the Public Service Railway of New Jersey in the number of one-man cars operated, serves four cities of more than 100,000 population, as well as many smaller communities. Neither of these companies operates any two-man cars. Numerous other railways are also on a 100 per cent one-man basis.

Because of the necessity in the South of separating white and negro passengers, the one-man car came into use more slowly there than in other sections of the country. Nevertheless it has been adopted to a considerable extent by the railways in Atlanta, Birmingham, Memphis, Richmond, Savannah, a number of Texas cities and elsewhere. Indications are that its use will become more general there as time goes on.

Substantial economies are obtained as a result of one-man operation. With wages around 50 to 60 cents per hour, and an average of 10 m.p.h., the saving approximates 5 cents per car-hour despite certain small additional expenses. Experience has shown that the accident hazard with one-man cars is no greater than with two-man cars. Schedule speed remains about the same. Well-designed one-man cars have proved popular with the riding public in many communities. Thus there is every prospect that the remarkable growth of the past few years will continue for some time to come.

Great Inland Empire System Under Trunk Line Auspices

SPOKANE, the center of the so-called Inland Empire System, was always proud of that property, which has recently passed to ownership by the Great Northern Railroad. It might be asked, of course, how, under these circumstances, it came about that the system was permitted to fall upon evil days. That is not quite so easy to answer, except in so far as the changed economic status of the property with the coming of the private automobile affords an answer.

The property was typical of the West. It was conceived liberally and carried to fruition the same way. For a long while it was moderately successful, but the price that was paid by the old owners was not one that could have been foreseen by even the most astute. That, however, is neither here nor there. Now the lines pass to one of the great trunk systems, destined no doubt for a career that the original promoters never dreamed. The Great Northern will, of course, tie in the lines with the rest of its system and so increase the usefulness of this 170-mile system. That the lines are in some sense strategic in the Great Northern scheme of things is beside the point. Their identity may eventually be lost in the larger significance of the Great Northern, but the fact remains that the original promoters of the line were men of vision who did more for the upbuilding of the communities that the road served than they ever did for themselves.

In the impending loss of their individual identity by the lines of the Inland Empire System there is more than a meed of satisfaction that their purchase and use by the Great Northern as electric feeders are in keeping with the general program of electrification of the company in the Pacific Northwest.

Posters on Poles Are Unsightly and Dangerous

PLACING advertising posters or placards on electric railway poles in the public streets is an objectionable and dangerous practice, difficult for the companies to stamp out. Where tubular steel, fabricated or reinforced concrete poles are used, less annoyance of this kind is experienced. Usually the advertiser finds it too much trouble to attach his placard to one of these poles. But many wood poles are still in use in city streets and along interurban lines. No ingenuity, and comparatively little effort, is required to place a placard on a wood pole. Some tacks and a few blows of the hammer are sufficient. Hence the habit of defacing poles in this way is widely prevalent.

From the railway standpoint this practice is doubly objectionable. It mars the appearance of the company's equipment, and creates a certain hazard to the men who are obliged to climb the poles in the course of their duties. The tacks used to fasten advertising material to the pole are likely to prevent the lineman's spurs from taking hold, thus causing him to slip and fall to the ground. Several accidents of this kind have been reported recently.

In some states the use of poles for this purpose is forbidden by law. Even where this is not done, the advertiser has no right to place placards on railway property without the consent of the company. The best way to combat the practice is to have all railway employees keep their eyes open for posters on poles, and to inform the management whenever any are found. The company can then have them removed and notify the advertiser to discontinue the practice, or appropriate legal action may be taken if required.

Will Traffic Congestion Force More Organized Street Use?

TRAFFIC congestion is a community problem as serious as any with which the modern city has to contend. All measures so far devised have failed to show the way toward permanent relief. Even the enormous expenditures for street widening which have been made in many cities have proved inadequate in the face of the constantly growing demand for street space.

Fundamentally, every individual in a community has a right to the free use of the streets. This right exists, however, only as long as its exercise by one individual does not interfere with the rights of others. When the free exercise of individual rights causes general inconvenience, danger and loss, then the needs of the community take precedence over individual right.

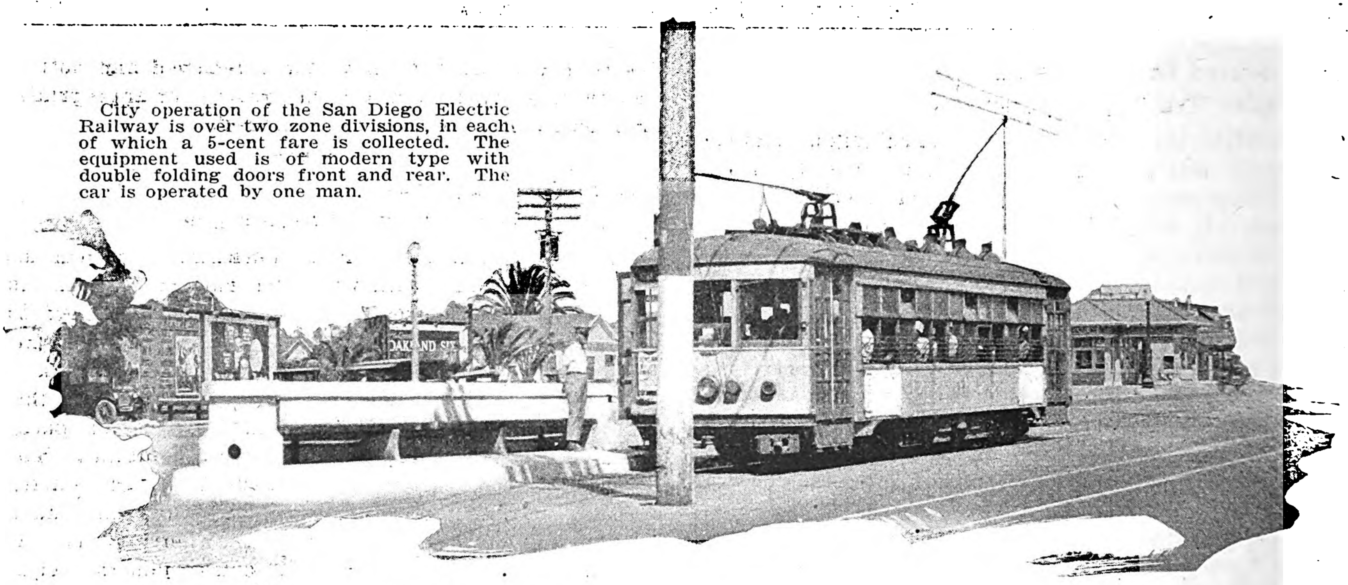
Relief of congestion is in a large sense a social problem. Social changes take place very slowly, particularly when they involve curtailment of the individual's rights. Progress is possible only after public opinion has been aroused to appreciation of the need for action. This will come in time. Public opinion is being aroused rapidly to the evils of parking in congested streets. It is recognized that the necessity of the many must take precedence over the convenience of the few.

Restriction, or elimination of parking, however, is not the whole solution for congestion. True, it cuts down the use of individual transportation, and in that respect helps the community and the public transportation companies. But the ownership of individual cars is widespread. They cannot all be classed as a luxury. In some cases they are a distinct convenience—even a necessity—when congestion does not largely restrict their usefulness. Due consideration must be given to this phase of the question if relief from congestion is to be obtained on a fair and equitable basis.

Regulation of traffic movement has nearly reached the limit of its possibilities in some cities. The next logical step seems to be organization. The period of maximum utilization extends over only a relatively small part of the 24 hours. During those periods public transportation, individual transportation and commodity movements are all at their peak. Even this does not adequately describe the situation. Vehicles move hither and yon, crossing, overlapping, some empty and some full. Thus, despite the limited street facilities, there is enormous waste in their use.

A railroad is in a sense comparable to a highway or a city street. It is an artery for the movement of passengers and commodities. If the rail line were operated in the wasteful way which characterizes our streets its capacity would be enormously reduced. The difference in usage today is the difference between organized use and unrestricted individual use.

Then, also, there is the freight vehicle which uses the streets and which is essential to the welfare of the community. Adequate recognition must be given to the movement of commodities in any scheme of congestion relief. To make this relief permanent and equitable, each factor in transportation must be given consideration in proportion to its importance to the community. Only when the problem is approached from this angle will the interests of the community be served best.

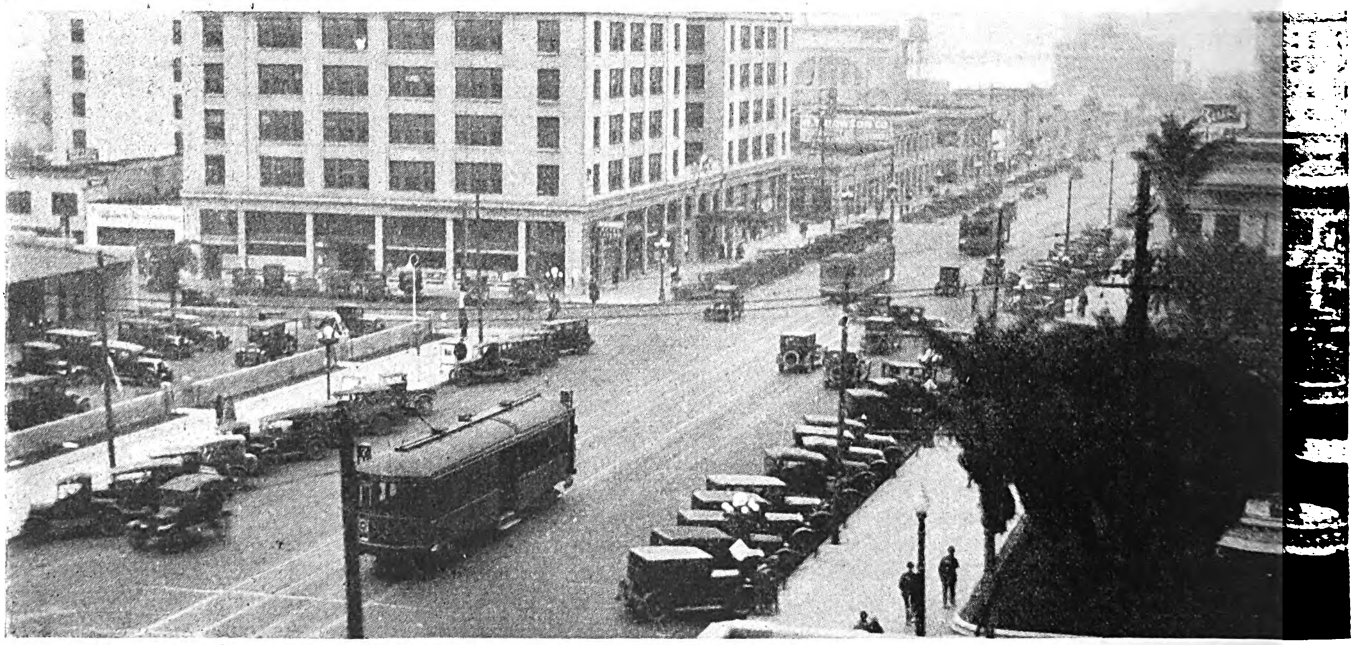


City operation of the San Diego Electric Railway is over two zone divisions, in each of which a 5-cent fare is collected. The equipment used is of modern type with double folding doors front and rear. The car is operated by one man.

Zone System Builds Revenue in San Diego

City division includes two zones each with 5-cent fare. Commission of 3 per cent gross sales of tokens, passes and special forms of transportation paid to operators

SUCCESS of the zone system of fares and the weekly pass in San Diego, Cal., is attributable, according to the management of the San Diego Electric Railway, to the co-operation of the platform men in perfecting this somewhat complicated fare-collecting arrangement. An incentive, in the form of a commission or bonus paid each year to those of the operating staff who make an effort to sell the service of the company as indicated by the sale of additional passes and tokens, maintains the enthusiasm of the men for the system. The commission amounts to 3 per cent of the total sale of passes, tokens and special forms of transportation sold by the platform men. It is divided on the basis of total hours worked during the year by each man. This results in increased compensation to those who make the effort to sell the product of the company, namely, transportation. Such sales facilitate the problem of fare collection. For with passes, the zone system of fares is simplified, as the pass may be presented in lieu of a fare, thus reducing the work on the part of the trainmen. Similarly, with tokens, the work of the trainmen is materially lightened and the time required for the interchange of passengers is reduced as it minimizes the amount of change making.



In the main section of the city a 5-cent fare is collected from the short rider. The weekly pass of $1, however, entitles the passenger to ride in both zones of the city division

Two divisions are operated by the company, one the city division and the other the interurban division. The latter includes the suburban and intercity lines to La Jolla and National City. The city division, covering all city lines, is divided into two zones. The inner zone limit is just outside a circle with a 1-mile radius from Fifth and Broadway, the main downtown loading and diverting point. Hence the maximum ride in the inner zone is approximately 1.15 miles and the transfer ride from one side of the city to the other within the inner zone is approximately 2.25 miles. The outer zone extends from the inner zone limits to the ends of the various lines, a distance varying from 1.82 miles to 5.20 miles. Three heavy transfer points are located in the outer zone.

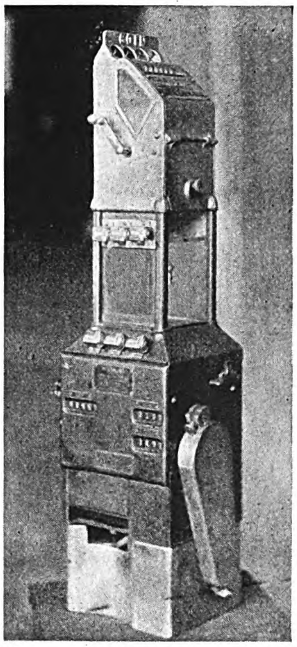
Map of the San Diego Electric Railway system showing the extent of the inner and outer zones

The inner zone is within a radius of approximately 1 mile from Fifth and Broadway, the heart of the business district. The outer zone extends from the limits of the inner zone to the ends of the city lines. The interurban systems are divided into 5-cent fare zones, the longest line—that which runs to La Jolla—having seven zones.

Fares on the city division are 5 cents cash in either zone and 10 cents cash for a single ride through both zones. Four metal tokens are sold for 30 cents, which makes the fare through two zones 7½ cents a ride. Weekly passes for both zones are $1. All city lines terminate downtown within the inner zone, as it would be impracticable for a line to operate from the outer zone, through the inner zone and out into the outer zone again, which would greatly complicate the handling of fares. Fares are collected once per trip, pay-as-you-enter inbound and pay-as-you-leave outbound. Because 80 per cent of the operation is with one-man cars, no attempt is made to identify or hat-check inbound passengers. However, the great majority of the travel is between homes in the outer zone and the downtown district. In addition 30 per cent of the number of fares are paid with the weekly pass. Outer zone riders are only a small percentage of the total. It is left to the operator to remember what 5-cent fares are collected in the outer zone and at the zone limit request additional fares. Hence, on inbound trips as passengers board the cars in the outer zone, they display a weekly pass, pay tokens, 10-cent cash fares, or 5-cent outer zone fares and are issued transfers, if requested. In the inner zone the passenger boarding displays his pass, pays 5 cents cash inner zone fare, 10 cents cash or token and, if the latter, is issued a transfer.

On outbound trips at downtown loading points all doors are opened. This practice facilitates the loading of passengers and a quick get-away. The fares are collected on the pay-as-you-leave plan, the operator handling a few at each stop, similar to the pick-ups on inbound trips. The passenger leaving the car in the inner zone pays 5 cents cash fare, inner zone transfer or displays a pass. Those riding into the outer zone pay the 10-cent fares or tokens or display passes. To the few who board the cars after leaving the inner zone an identification check is issued, which is returned to the operator with the outer zone fare as the passenger leaves the car.

Johnson fare boxes are used on all cars and for



Air-operated fare box used at San Diego

Use is made of the Johnson fare box for collecting all cash fares. However, to designate the 10-cent cash fares from the 5-cent cash fares a Veeder counter is mounted on the side of the box. Another counter is used for recording weekly passes and a third is used for recording school passes. Fare boxes on the interurban cars have additional counters for recording the various zone cash fares collected. This box is air operated.

statistical purposes have attached to one side three small Veeder counters, one for recording the number of 10-cent fares deposited, another for recording weekly passes and another for recording school passes.

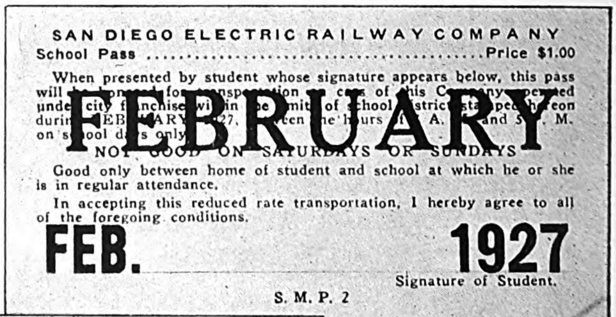
The interurban divisions are likewise divided into zones. On the National City line an additional zone to the two city zones is included. This line is covered by a $1.25 weekly pass or a 15-cent cash fare. On these cars an additional Veeder counter is mounted on the farebox for tallying the 15-cent cash fares deposited in the box. The records of 10-cent and 15-cent cash fares enable the auditing department to compute the number of passengers carried from the cash turned in. The Ocean Beach and Mission Beach interurban line has four zones, while the La Jolla line has seven. On these lines, however, the fare collection is handled on the pay-within plan. The fares are collected by various forms of car tickets, weekly passes, duplex tickets and with cash fare receipts.

Interurban weekly passes, of which there are several covering the four branches of the system, are sold by operators on cars of the respective lines. All passes, both city and interurban, are sold at the ticket office. As more than 90 per cent of the city passes are sold during the first inbound trip Monday morning operators are kept busy during the trip. The dollar sale of the pass, however, is made with no more trouble than collecting a cash fare, and the necessity for further change, transfer and identification checks is eliminated for the whole week. The only additional work consists of recording the pass rides on the Veeder counter when the pass is presented.

Increased riding and revenue have resulted from the sales methods employed. Revenue has shown a consistent gain for the past two years of approximately 5 per cent. This is attributed by the company to the popularizing of street car riding in San Diego by the zone fare system and the weekly pass. For the week of Jan. 10 to 16, which was an ordinary week, 7,831 passes were sold at $8,221.75, which provided 201,064 pass rides. While the pass revenue is not entirely satisfactory on account of the low rate per ride, it is kept in mind that passes are recorded each time they are presented, even though the passenger transfers twice during a single trip. Many of the pass rides are for a few blocks for convenience and the company is satisfied that the additional rides above the two peak rides each day are during the time when there is plenty of room to handle this additional patronage without additional expense.

As a result of the simplification of fare collection through the use of the weekly pass and tokens the company has been able to extend its one-man operation. Modifications have been made in the equipment to allow for this. The center-entrance type of car has been rebuilt to permit of one-man operation. End doors of the double folding type have been built in, the depressed center section raised and the side panels extended straight through at the point where the center doors were located. This work of modernizing the equipment has been going on in the shops of the company for approximately two years.

Almost all of the equipment is now



SAN DIEGO ELECTRIC RAILWAY COMPANY

School Pass .... Price $1.00

When presented by student whose signature appears below, this pass will [illegible] for transportation [illegible] cars of this Company operated under city franchise within the limits of school district stamped hereon during FEBRUARY, 1927, between the hours of [illegible] A. M. and [illegible] P. M. on school days only.

NOT GOOD ON SATURDAYS OR SUNDAYS

Good only between home of student and school at which he or she is in regular attendance.

In accepting this reduced rate transportation, I hereby agree to all of the foregoing conditions.

FEBRUARY

FEB. 1927

Signature of Student.

Where the Ocean Beach and La Jolla lines operate over the same track two-car trains are sometimes coupled together into four-car trains

Seven fare zones cover the longest of the interurban lines of the San Diego Electric Railway. Use is made of the automatic coupler for making and breaking up trains of the Ocean Beach and La Jolla lines at the junction of the two routes. On the interurban system the zone fare is collected within the car by the conductor. Two-car trains are operated to the junction point with three men. The forward car has the motorman and conductor, while the rear car has the combination motorman-conductor-operator. Beyond the junction the operator of the second car becomes the motorman and in addition collects the small number of fares in that short branch of the division. Sometimes four-car trains are operated.

changed over and the company is going ahead with the installation of leather-upholstered seats in the newer type of car. These improvements in the interior appointments, combined with an improved painting schedule, assisted materially in popularizing the street car ride.

On the Ocean Beach and Mission Beach-La Jolla interurban line the automatic coupler is used when the break in the train is made at the junction of the two lines. Its use has speeded up considerably this operation and has helped to meet the direct competition of one of the large established bus lines in the state. However, because of the modern type of equipment used and the speed and frequency of the service, the company feels that it is making gains even against well-operated bus competition.

New Traffic Regulations in Cincinnati

PEDESTRIANS have been given greater consideration in the new traffic regulations of Cincinnati, Ohio, effective May 6, according to Grover C. Smith, safety secretary of that city, who prepared a summary of this ordinance for the benefit of the public.

Section 680-5, in part, compels a motorist to stop when a pedestrian indicates his intention to board an approaching street car, provided the street car is within 100 ft. of the pedestrian. This rule applies where there is no safety zone.

In the section on speed limits, motor coaches are limited to a maximum speed of 25 m.p.h.

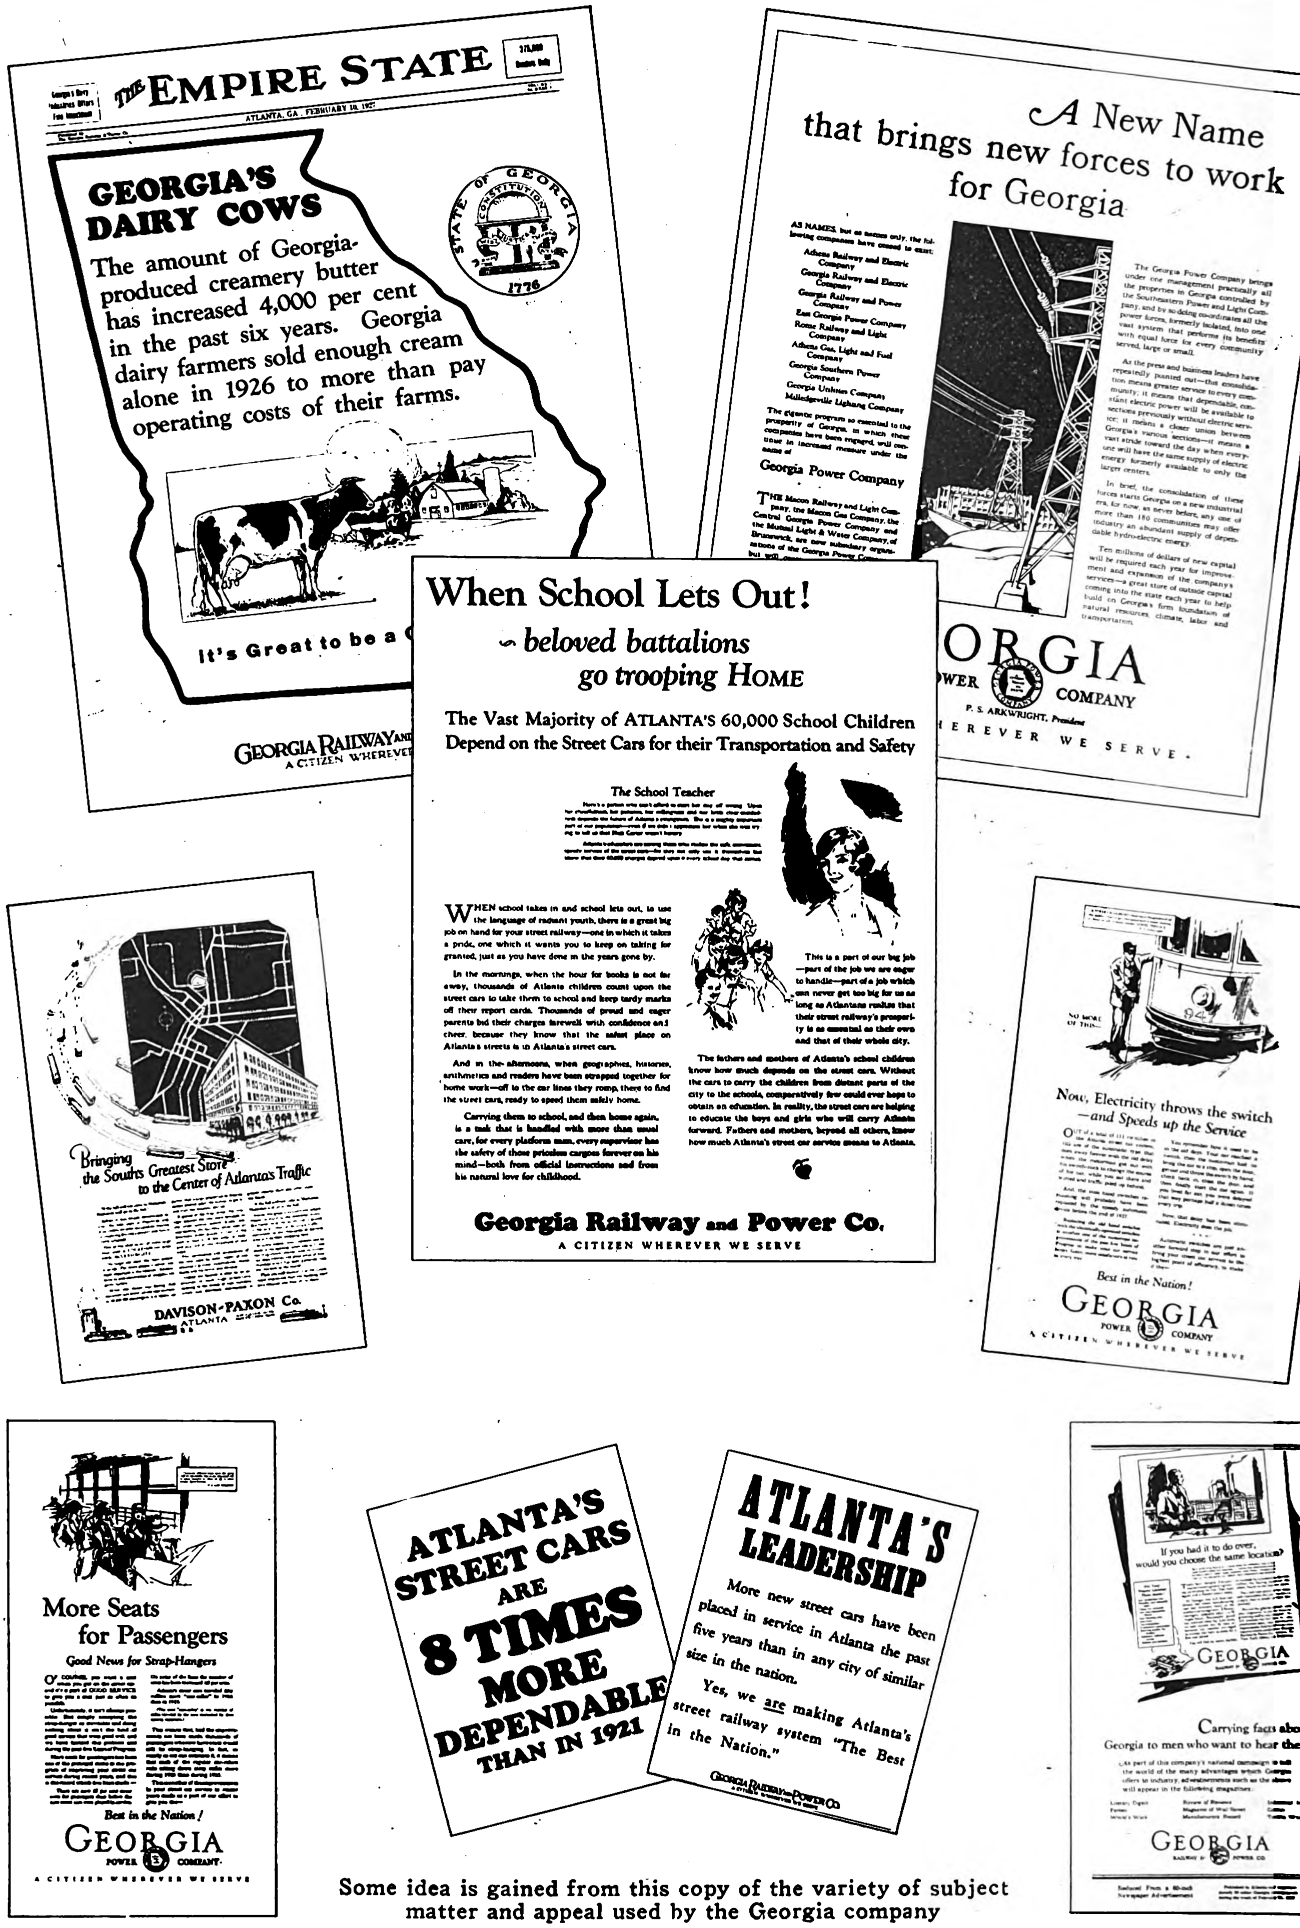
Steps were also taken to reduce congestion and traffic delays. Mr. Smith states on this score:

> One very serious problem in the past has been traffic obstruction and delay caused by backing trucks to the curb to unload. Under the 1927 ordinance this is prohibited in the congested district, excepting that coal trucks and building material trucks are permitted to back into the curb to unload between certain hours only. Outside the congested districts trucks may back to the curb at an angle not greater than 45 deg. The city manager is authorized to issue permits to back trucks to the curb in cases where it will be impossible to unload otherwise.

The ordinance has several new provisions for parking. The safety secretary announces that this ordinance is less restrictive on this point. In explaining this phase he says, in part: "The old ordinance prohibited all parking between the hours of 6:30–9:30 a.m. in the congested district. The new ordinance makes no blanket restrictions, but provides that police signs may forbid parking where the interests of the public require it. Under the present ordinance more than 50 per cent of the streets in the congested district will be open for parking between 7 and 9 a.m., whereas under the ordinance that was formerly in effect there was no parking at this time.

"It is the desire of the administration to provide as much curb parking space as possible. In order to do this the new ordinance prohibits the placing of unauthorized 'No Parking' signs or other traffic markers on any sidewalk or street. In this connection and in order to take care of the acute situation that has developed in the downtown section of the city the city manager is empowered to set aside loading space for any business house where he may deem the same to be necessary."

In regard to taxicabs, the most important change in the ordinance is that four taxicabs will be permitted to park anywhere in any city block not including those cabs that may be parked on authorized taxicab stand sites.



THE EMPIRE STATE

ATLANTA, GA., FEBRUARY 10, 1927

GEORGIA'S DAIRY COWS

The amount of Georgia-produced creamery butter has increased 4,000 per cent in the past six years. Georgia dairy farmers sold enough cream alone in 1926 to more than pay operating costs of their farms.

It's Great to be a G

GEORGIA RAILWAY AND
A CITIZEN WHEREVE

A New Name that brings new forces to work for Georgia

AS NAMES, but as names only, the following companies have ceased to exist:

Athens Railway and Electric Company
Georgia Railway and Electric Company
Georgia Railway and Power Company
East Georgia Power Company
Rome Railway and Light Company
Athens Gas, Light and Fuel Company
Georgia Southern Power Company
Georgia Utilities Company
Milledgeville Lighting Company

The gigantic program so essential to the prosperity of Georgia, in which these companies have been engaged, will continue in increased measure under the name of

Georgia Power Company

THE Macon Railway and Light Company, the Macon Gas Company, the Central Georgia Power Company and the Mutual Light & Water Company, of Brunswick, are now subsidiary organizations of the Georgia Power Com
but will

The Georgia Power Company brings under one management practically all the properties in Georgia controlled by the Southeastern Power and Light Company, and by so doing co-ordinates all the power forces, formerly isolated, into one vast system that performs its benefits with equal force for every community served, large or small.

As the press and business leaders have repeatedly pointed out—this consolidation means greater service to every community; it means that dependable, constant electric power will be available to sections previously without electric service; it means a closer union between Georgia's various sections—it means a vast stride toward the day when everyone will have the same supply of electric energy formerly available to only the larger centers.

In brief, the consolidation of these forces starts Georgia on a new industrial era, for now, as never before, any one of more than 180 communities may offer industry an abundant supply of dependable hydro-electric energy.

Ten millions of dollars of new capital will be required each year for improvement and expansion of the company's services—a great store of outside capital coming into the state each year to help build on Georgia's firm foundation of natural resources, climate, labor and transportation.

When School Lets Out!

beloved battalions go trooping HOME

The Vast Majority of ATLANTA'S 60,000 School Children Depend on the Street Cars for their Transportation and Safety

The School Teacher

WHEN school takes in and school lets out, to use the language of radiant youth, there is a great big job on hand for your street railway—one in which it takes a pride, one which it wants you to keep on taking for granted, just as you have done in the years gone by.

In the mornings, when the hour for books is not far away, thousands of Atlanta children count upon the street cars to take them to school and keep tardy marks off their report cards. Thousands of proud and eager parents bid their charges farewell with confidence and cheer, because they know that the safest place on Atlanta's streets is in Atlanta's street cars.

And in the afternoons, when geographies, histories, arithmetics and readers have been strapped together for home work—off to the car lines they romp, there to find the street cars, ready to speed them safely home.

Carrying them to school, and then home again, is a task that is handled with more than usual care, for every platform man, every supervisor has the safety of those priceless cargoes forever on his mind—both from official instructions and from his natural love for childhood.

This is a part of our big job—part of the job we are eager to handle—part of a job which can never get too big for us as long as Atlantans realize that their street railway's prosperity is as essential as their own and that of their whole city.

The fathers and mothers of Atlanta's school children know how much depends on the street cars. Without the cars to carry the children from distant parts of the city to the schools, comparatively few could ever hope to obtain an education. In reality, the street cars are helping to educate the boys and girls who will carry Atlanta forward. Fathers and mothers, beyond all others, know how much Atlanta's street car service means to Atlanta.

Reduced From a 80-inch Newspaper Advertisement

Some idea is gained from this copy of the variety of subject matter and appeal used by the Georgia company

Car Publicity as They Write It in Georgia

Marching through Georgia with the pen instead of the sword, the Georgia Power Company is selling popular transportation from practical, emotional and social angles

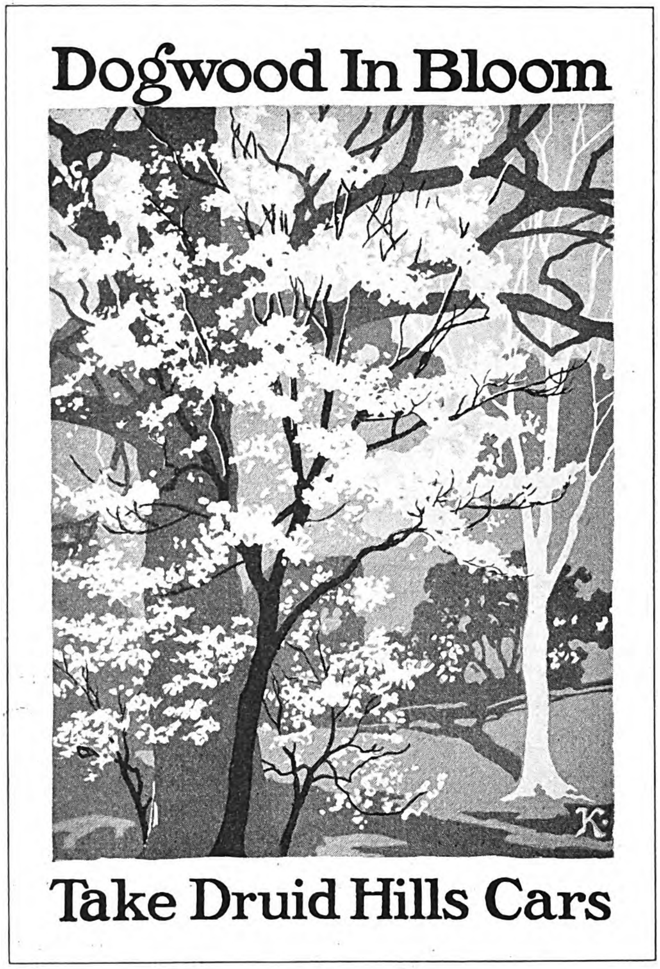
YEARS ago a certain gentleman who said "War is Hell" got a lot of unfavorable publicity in Georgia by a campaign of destruction. History records that he had a pretty rough time traversing the state and that Atlanta didn't offer him any transportation facilities. But that was before the Georgia Railway & Power Company and its successor, the Georgia Power Company, started a publicity campaign. Doubtless were the gentleman to arrive today in the "Gate City of the South," with the same crowd behind him, he would order "stack arms" and make a rush for the nearest street car, completely defeated by the force of the pen as wielded by L. K. Starr, manager of public relations, and his corps.

Whether one is wrong or right in this assertion matters little when it is evidenced that thousands of Georgia's citizens are being sold on modern street car transportation because the Georgia Power Company is using in its publicity copy logical arguments and forcible illustrations to impress the public that it strives to be "A Citizen Wherever We Serve." This is no new move on the company's part, as readers of the JOURNAL will doubtless recall that from time to time progress of the publicity campaigns has been detailed in these pages, notably in Vol. 66, page 351, and Vol. 68, page 345.

As before evidenced, the company visualizes the transportation needs in terms of those everyday contingencies that confront the average citizen. Take, for example, the recent five-column advertisement, 14 in. deep, which appeared in the rotogravure section of the Atlanta *Journal* for March 6. "Smooth Going at Home!" it was headed, and then followed this text:

> The whole family, every day, gets comfort and convenience from the street car.
>
> The cook arrived on time, the children are safely off to school, the postman has brought the morning mail, everything running nicely, and the street car helped it along!

And then the text goes on to remind one of the part a street car plays in a trip to market, a visit to a friend, or to the park with the children or to the movies. All without parking worries, or in the latter event, the strain incident to driving in after-theater traffic. This advertisement was well balanced by sketches of father, mother and the children, and ample white space gave the reader the impression of dignity.



Skillful use is made here of the esthetic appeal

Turning from this homely appeal, one finds a subtle piece of copy directed at the "Men who never ride the street cars"; in other words, those citizens who roll up to their places of business in a limousine. This class of Georgian is not presented with an argument to forsake his means of transportation, but rather is reminded in a few pithy paragraphs that his business depends on the street car. For instance, one reads:

> You may be the head of a great manufacturing plant. Your limousine carries you there and calls for you at your convenience. But your workers depend on street car service without exception.
>
> You may never ride the street cars. You may drive to the office in your own car, day after day, the year round. But the people who keep your business going are street car riders.
>
> The banker knows that street car riders have built his bank.
>
> The capitalist also, and the real estate man—they know that property values are based on street car service.
>
> They (street cars) keep the cash registers ringing.

Here the responsibility for seeing that fair treatment is accorded the utility, carefully interwoven with an economic argument, is forcibly presented to the heads of big business.

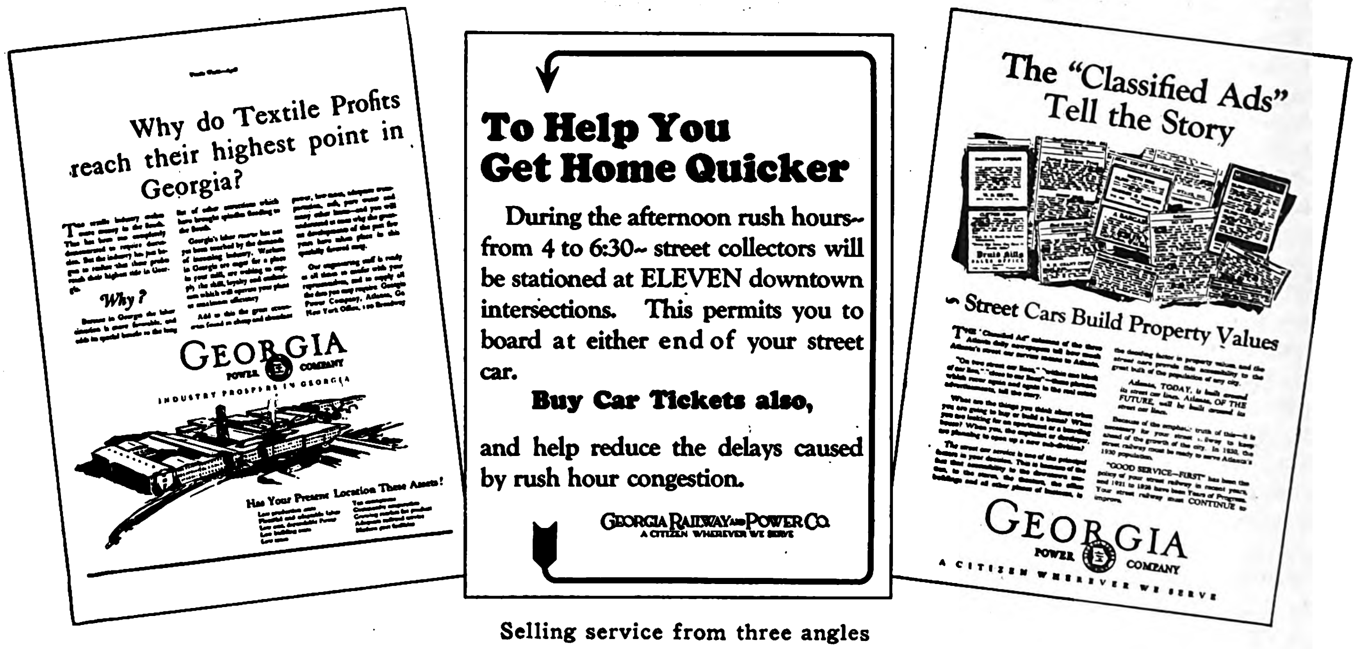
In the March 12 issue of this paper W. H. McAloney, superintendent of equipment, told the field that in the last three years Atlanta has set the torch to 170 old cars and in their place are 196 new four-motor, low-floor cars. In a 60-in. advertisement appearing in the Atlanta *Journal, Constitution* and *Georgian* the traveling public was told something of the new cars in a way that appeals to the modern idea for speed. "Pick Up and Get Away" was the appeal slogan for this piece of copy and the Atlanta citizen was invited to imagine the street cars in terms usually associated with the operation of a high-class automobile. The following paragraph will suffice as an example of the text:

> A wealth of reserve power and speed is available—for the new street cars on city lines are capable of 30 miles an hour, while the palatial new interurban cars will run at 50! Of course, such speed is not needed or used, but isn't there a satisfaction in knowing what reserves of speed are in the powerful motors of your street cars?

Another forceful example of copy reveals that a new car talking point is developed also from the standpoint of miles per hour which have been gained in operation since 1923. One outstanding paragraph, it will be noted, contains a comparison of speed of Atlanta's cars with that of Chicago's. Another paragraph acknowledges the company's debt to the public by reason of the public's co-operation in eliminating car stops. Also to the efficiency of the company's employees. This copy, like all of the other samples on review, is characterized by extreme modesty in so far as the Georgia Power merchants realized that they must locate where the street cars delivered the most passengers to the business district.

In glancing over other samples of the company's publicity copy one is particularly struck with the unique twist that is given to small and often forgotten equipment items and how these items are woven into powerful selling arguments. For instance, one piece of copy shows the motorman down on the ground in front of his car. He is holding an old switch stick. To the left of him are the words, "No more of this—," and below is this central theme:

> Now electricity throws the switch—and speeds up the service.
>
> Out of a total of 111 switches in the Atlanta street car system 102 are of the automatic type that does away forever with the delays when the motorman got out his switch stick to change the course of his car while you sat there and waited and traffic piled up behind.



Why do Textile Profits reach their highest point in Georgia?

Why?

GEORGIA RAILWAY AND POWER CO.
A CITIZEN WHEREVER WE SERVE

The "Classified Ads" Tell the Story

Street Cars Build Property Values

GEORGIA POWER COMPANY
A CITIZEN WHEREVER WE SERVE

Selling service from three angles

Company is concerned, which probably accounts for the fact that the Davidson Paxon Company, one of the largest department stores in Atlanta, in a full-page advertisement, used the street car service as a central theme when acquainting the public with the accessibility and convenient location of its new store at Peachtree and Ellis Streets.

As the reader may not be able to decipher some of the paragraphs of this ad appearing in the accompanying illustrations, two paragraphs are quoted to show what a vital element street car service was considered when these merchants decided on a new location:

> When you realize that during 1926 our street cars alone carried approximately 90,000,000 passengers, it is readily apparent that a large proportion of Atlanta's people depend upon the trolleys to get to and from the business districts.
>
> A glance at the map reveals the strategic position the new store occupies to the street railway system. Every line approaching the business center from all directions either passes in front of the store or near it. A few steps, at most, and you are on the threshold of our store.

"If the hill will not come to Mahomet, Mahomet will go to the hill." This was one of the italicized paragraphs of the ad, which strikingly illustrates how these

Another advertising twist that is of great interest consists of giving the public a comparison of the power failures of 1922 with those of 1926. This argument backs up the central publicity message: "Dependable even in storms! Service when you need it." The text also contains a paragraph such as this:

> Out of the 365 days in 1926 there was 348 days on which there were no interruptions of this kind at all. Thanks to a complete modernization of our electric distribution system.

Pursuing the dependable theme, another advertisement, captioned "Around the World Without a Breakdown," explains to the layman what the term "Pull In" means, and then proceeds to give some telling figures as to how Atlanta stands with respect to "miles per pull in."

The text goes on to recount that the street railway companies have a "Southern League" of their own, and the 1926 totals on "miles per pull in" put Atlanta ahead of most of the other Southern cities in the league. Then a table is shown of Atlanta as compared with Little Rock, Memphis, Birmingham, Mobile, Dallas, Covington, Ky., Montgomery and Chattanooga.

Again driving home the dependability and service ideas large advertisements feature the tremendous responsibility that is placed on the street car company when the doors of the big stores close. From this theme one turns to the copy, reproduced elsewhere, which sells the street car on the basis of what it does in developing property.

In the realm of strictly industrial copy, one is attracted by an enormous advertisement captioned: "A New Name that Brings New Forces to Work for Georgia." Here a bold center illustration in black and white, showing a high-power transmission line, is flanked on either side by text describing the new combinations which made the Georgia Power Company successor to the Georgia Railway & Power Company. This copy was published in page form in practically every daily and weekly newspaper in Georgia.

In the field of national advertising the company has been most active. In this case, of course, Georgia is being sold on the basis of its hydro-electric developments. These ads have appeared in *Industrial Index, Furniture, Manufacture and Artisan, Industrial Management, Forbes, Cotton, Manufacturers' Record, American Woolen-Cotton Reporter, Finance, Printers' Ink, Magazine of Wall Street, Textile World* and *System,* and with the advent of the new year such magazines of general circulation as the *Literary Digest* and *World's Work* have been added to the company's advertising list.

While strenuous efforts have been exerted in national and local newspaper and periodical advertising, the company has not neglected its campaign of "window pasters," which for the most part are done in two-color inks on a background of white, yellow, green and orange paper. These pasters are in three sizes, 9½x18 in., 16x21 in. and 22½x27 in. In the smallest class such text matter as this has been used:

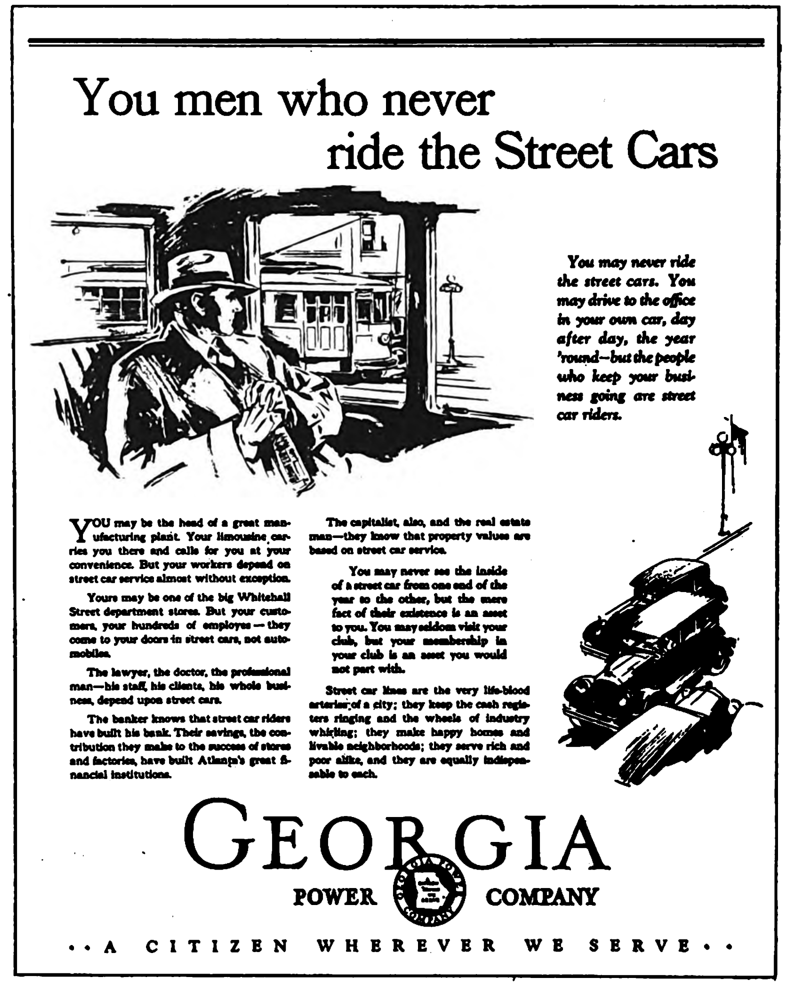
> For Atlanta's sake your street railway must be ready to serve the new population Atlanta will have in 1930. It's a good street car service now! It must be better in 1930. We believe that the only means of obtaining the friendly good will of the public is to deserve it. (This is signed by P. S. Arkwright, president of the company.)
>
> For your children's sake! Skating and playing in the streets not only are dangerous but are prohibited by law. Protect your children. Keep them out of the streets.
>
> Buy one dollar's worth of convenience—fifteen car tickets—a week's supply—for a dollar. Give it a trial.

On 16x21 pasters such appeals as these are made:

> Who pays for accidents? Can you afford weeks in a hospital? Your savings wiped out and probably heavy debts, perhaps the loss of your job? What of your family, your wife, your children? Can they afford to have you injured, perhaps permanently crippled? Think and practice safety.

As further proof that the Georgia Power Company thinks in other terms besides money and revenue, window pasters of the size 22½x27 carry such esthetic messages as this: "Dogwood in bloom. See it, but leave it for others to see." And from the commercial side, such captions as these: "Our goal, the best street car service in the nation." "More dependable! Power failures reduced—1922, 148; 1926, 17." And then the civic appeal, "Please don't throw paper on the streets. Help keep Atlanta's streets clean." "Your street railway must continue to improve."

And now to sum up briefly the publicity policy of the Georgia property one turns to the words of L. K. Starr: "Our street railway," he writes, "has made an unusually good record during the past five years. We have increased the speed of the cars, reduced power failures, increased the seating capacity and bought more new street cars than any other city of Atlanta's size in the nation. We are now telling the public of these improvements and future advertisements will tell about others.



You men who never ride the Street Cars

You may never ride the street cars. You may drive to the office in your own car, day after day, the year 'round—but the people who keep your business going are street car riders.

YOU may be the head of a great manufacturing plant. Your limousine carries you there and calls for you at your convenience. But your workers depend on street car service almost without exception.

Yours may be one of the big Whitehall Street department stores. But your customers, your hundreds of employes—they come to your doors in street cars, not automobiles.

The lawyer, the doctor, the professional man—his staff, his clients, his whole business, depend upon street cars.

The banker knows that street car riders have built his bank. Their savings, the contribution they make to the success of stores and factories, have built Atlanta's great financial institutions.

The capitalist, also, and the real estate man—they know that property values are based on street car service.

You may never see the inside of a street car from one end of the year to the other, but the mere fact of their existence is an asset to you. You may seldom visit your club, but your membership in your club is an asset you would not part with.

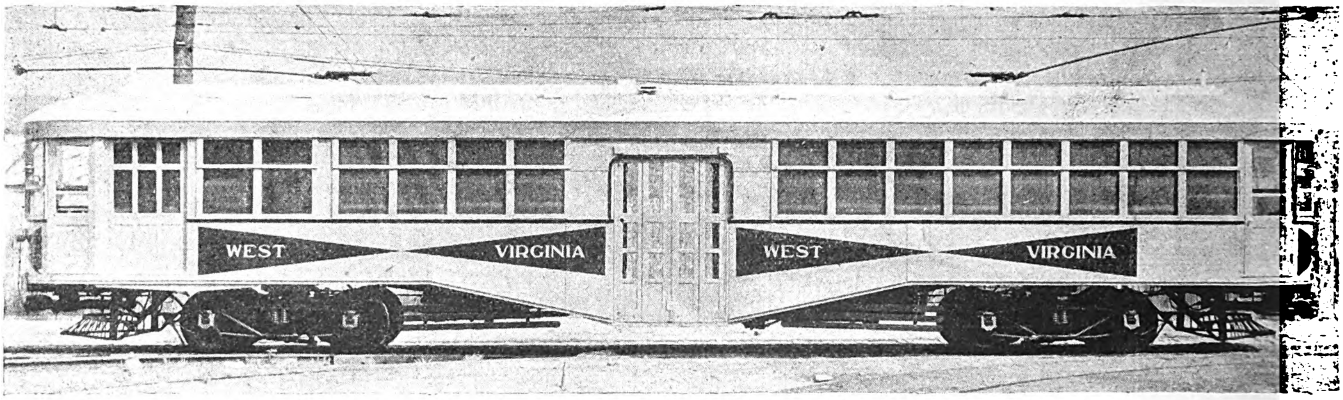
Street car lines are the very life-blood arteries of a city; they keep the cash registers ringing and the wheels of industry whirling; they make happy homes and livable neighborhoods; they serve rich and poor alike, and they are equally indispensable to each.

GEORGIA
POWER COMPANY

· · A CITIZEN WHEREVER WE SERVE · ·

A direct bid for support from the capitalist

"You will notice the slogan 'Best in the Nation' is being used on each of these advertisements. This appeals to the pride of Atlanta people and apparently is having excellent effect. Recently we decided to test the effectiveness of these advertisements, and we asked our patrons to write us letters about the service. More than 200 letters were received in about ten days and, with the exception of two or three, all were warmly favorable to the company and its policy of 'Good service first.' This policy of the company is expressed in a quotation from one of Mr. Arkwright's speeches, 'A street railroad must have the good will of the public, but to get the good will it must deserve it. First of all it must render good service,' which is carried in a box in most of the advertisements. It is our intention from this point on in this series of advertisements to bring this idea of good service into greater prominence in the advertisements."



Painting of the car has been done with the colors of West Virginia University

Introducing the "West Virginia"

West Penn Railway Buys de Luxe Car Developed Especially for Fairmont-Clarksburg Limited Service—Comfort Features Attract Many New Patrons

IN OPERATION between Fairmont and Clarksburg, W. Va., is a new passenger interurban car which has recently been purchased by the Monongahela-West Penn Public Service Company. Known as the "West Virginia," in honor of West Virginia University, the body of the car has been painted in old gold and the name lettered in blue, these being the colors of the university.

Every description of up-to-date rolling stock which is being purchased these days of necessity places a great deal of emphasis on the various facilities which are provided to add to the comfort of the passenger. The "West Virginia" may differ in degree, but not in kind, from this general rule. Deep spring leather seats are provided, and there is a group of facing seats to accommodate passengers who wish to indulge in a game of cards or some similar pastime during the trip.

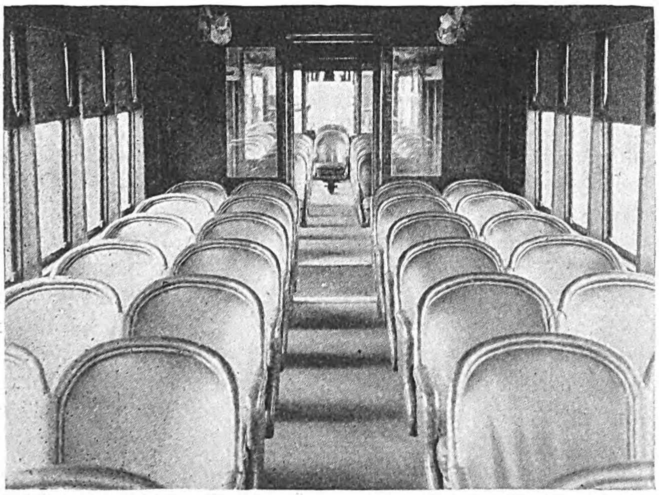
A Seat for Every Passenger

Including the new single seats which are located in the center of the aisle near the rear vestibule, seats for 63 passengers are provided. The company has adopted a rule applying to this new car, which states that at no time will more passengers be accepted than may be provided with seats, so that crowding is impossible.

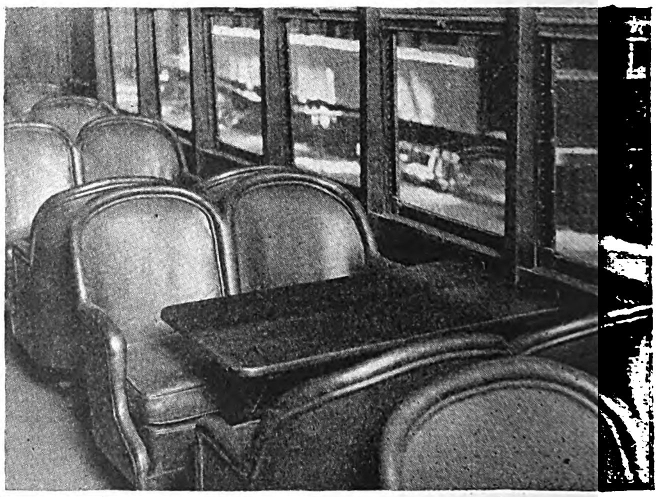
The car is of the double-truck, all-steel, center-entrance type and was built by the Cincinnati Car Company. Electrical equipment was provided by the Westinghouse Electric & Manufacturing Company, while the trucks were built in the shops of the West Penn Railways. This latter equipment was developed especially for operation over the Fairmont-Clarksburg run. The motors, of which four are provided, have a capacity of 65 hp. each.

The car is geared for a maximum speed of 45 to 47 m.p.h. It is 58 ft. in length and is divided into a regular passenger compartment, accommodating 35 passengers, and a smoking compartment, with seats for 28 passengers. Interior illumination is by 25 50-watt lights. The car is heated by 27 single coil, 400-watt heaters, which are thermostatically controlled. The cost complete for the car was $21,367; the body and underframe costing $10,972, the electrical equipment $5,725 and the trucks $1,921. Special seating equipment and interior fittings added $2,749 to the total cost.

The car makes only four stops between Fairmont and Clarksburg, the elimination of other stops and the higher operating speed of the car making possible a reduction of 25 minutes from the former running time between the two cities. Public patronage of the "West Virginia" has been increasingly heavy since it was first placed in service and there has been much favorable comment in the various communities served by the car concerning this effort of the West Penn Company to better its service.



Looking to the rear through the smoking compartment, showing the seats located in the aisle near the vestibule



For the convenience of patrons who desire to indulge in a card game these facing seats were installed

Electric Track Switch Protection for Joint Operation

Key System Transit Company and Southern Pacific Railroad have novel system for protecting a short section of track in Oakland, Cal. Both pantograph and trolley wheel contactors are employed

JOINT operation by the Key System Transit Company's cars and the suburban cars of the Southern Pacific Railroad over a short section of the former's city track in Oakland, Cal., on Webster Street between Fourteenth and Twentieth Streets, required the installation of electric switches at each end of the joint track and in addition a locking device to guard against either company's cars splitting the switch. An ingenious arrangement for doing these two things was worked out by the electrical engineering department of the Key System Transit Company.

Standard Cheatham electric switches were installed at the ends of the section, thrown in the usual manner through overhead contactors on the trolley wire and locked when trolley wheel or pantograph passes under.

Electric switch light signal (Green for straight route, Yellow for diverging route)

Switching arrangement making it possible for suburban trains of the Southern Pacific to operate over the city tracks of the Key System

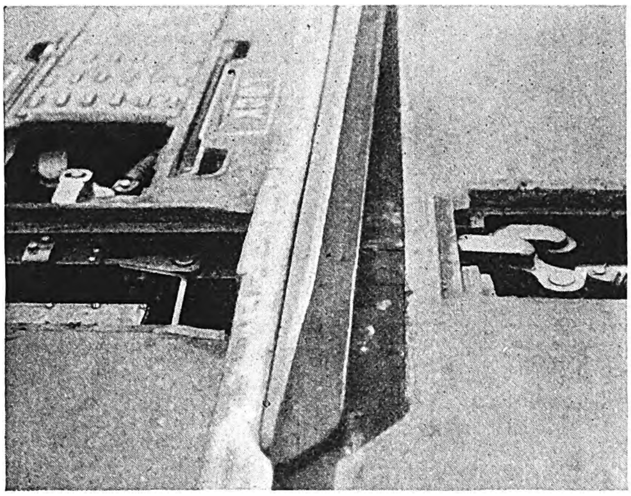
Four contactors are used, two for the Key System cars and two for the Southern Pacific cars. The Southern Pacific operates with pantograph and the Key System with wheel.

The Key System cars use trolley wheels; those of the Southern Pacific use pantographs. This required two types of contactors properly spaced to allow for operation of both wheel and pantograph.

Throw-and-lock contactors, one for wheel and the other for pantograph, are placed in advance of the switch a sufficient distance to allow for the throwing and locking of the switch before the front wheels of the forward truck reach the switch. Releasing contactors beyond the switch unlock it when trolley wheel or pantograph passes under them. The switch is also connected electrically with a signal having one green light and one yellow light. Green indicates that the switch has been properly lined up and locked so that the car may proceed over the straight track; yellow that the switch is set for the diverging route. After the car has passed the releasing contactor, thus unlocking the switch, neither green nor red light shows. Absence of a light in this signal as the car approaches the switch indicates that it is unlocked and that the motorman may proceed past the first contactor. However, after passing the contactor, if a light does not appear it indicates that the switch is not properly locked and that the car must be stopped before passing over the switch.

Should the switch fail to take the correct position or the signal fail to indicate the proper direction after the car passes the throw-and-lock contactor the crew must set the switch manually. For this purpose two hand throw levers are placed near the switch mechanism, one on each side of the locking device. One is to lock the switch, the other to unlock it. After the crew has determined if the tongue-way is free from obstruction the unlocking lever may be raised and the switch tongue thrown by a switch iron to the correct position. The unlocking lever is then lowered and the locking lever raised to lock the switch in this position. The car may then proceed after the crew has ascertained that it is locked, either automatically, as indicated by the signal light, or by hand.

Because of the two types of equipment it was unnecessary to instruct the motorman in throwing the switch, with power on for one way and power off for the other. When the pantograph passes its contactor the switch is automatically thrown in position and locked. Sim-



Switch tongue is thrown by mechanism located between rails. It is locked in position by mechanism located outside of track and parallel to the rail, as shown in the upper left hand corner

ilarly when the wheel passes its contactor the switch is thrown and locked in the other position.

The contactor for the pantograph consists of a light framework of two runners approximately 10 ft. long, supported at the ends above the trolley wire and at two center points below the wire. One runner is broken at the middle, its ends being separated by an insulated joint. The continuous runner is positive, 600 volts, while the broken one is negative.

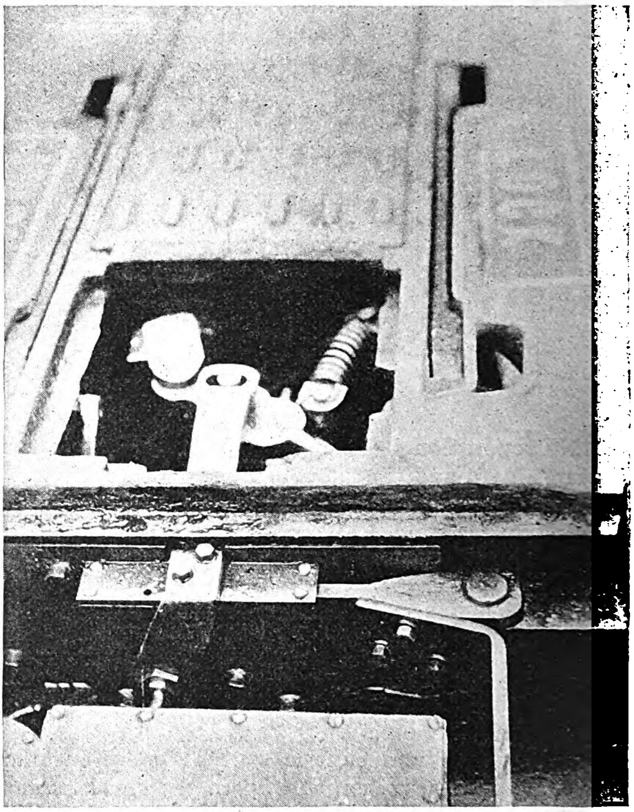
As the pantograph rides down on the runners of the contactor it first closes the circuit which throws the switch into the proper position and then closes the locking circuit.

RUNNERS DEPRESS PANTOGRAPH WHEN PASSING WHEEL CONTACTOR

The contactor for the trolley wheel is of the standard type. However, one side is split, so that the wheel first closes the switch-throwing circuit and then the locking circuit.

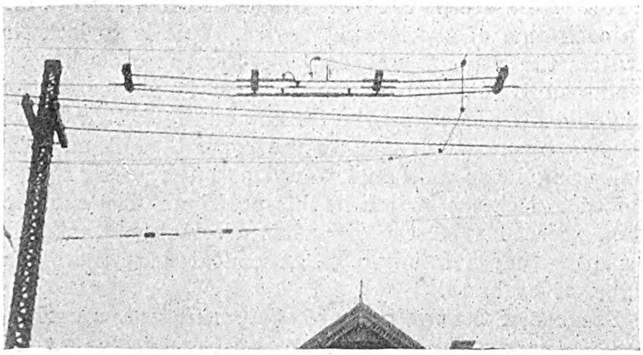
To protect the wheel contactors from the pantograph, runners are placed on the wire so that the pantograph is lowered. The wheel, of course, has no difficulty in passing through the pantograph contactor. Similar contactors are placed beyond the switch. However, in this case no protection is required for the wheel contactor which is on the track over which operate only the traction cars.

Energy from the contactors is brought down to a standard electrically operated track switch. The first circuit closed throws the switch and also operates in a signal switch box one-half of a switch contactor. The second circuit closed by the pantograph or trolley wheel operates a similar switch-throwing mechanism placed parallel to the rail. This solenoid thrusts a bolt through the stem of the main switch-throwing arm. It also moves in the signal indicating box the other half of the contactor switch. The proper alignment of these signal-indicating switches lights either the yellow or green signal on the pole.

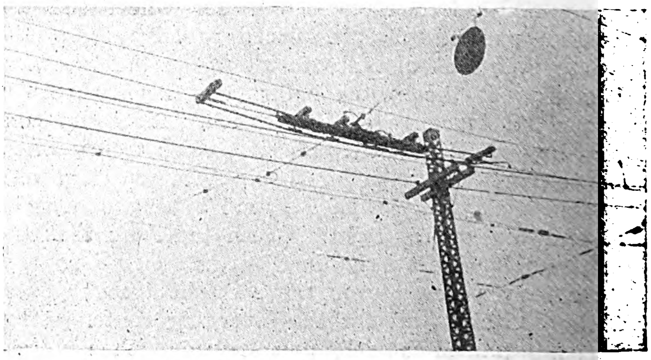


The locking mechanism is similar to the throwing mechanism. It thrusts a bolt through the extended end of the throwing arm. The signal changing box is in the immediate foreground. Rods from both the operating and locking mechanism close the proper switches to obtain the proper indication

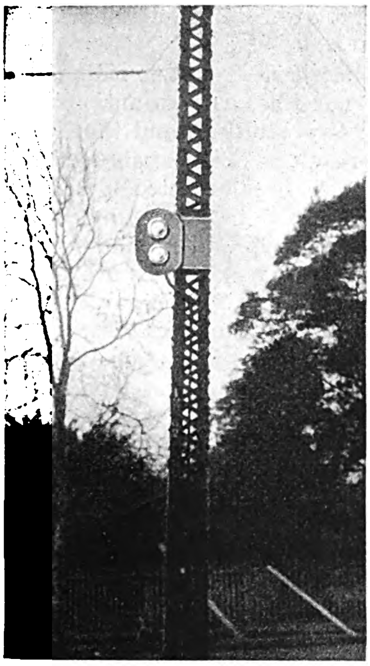
When the pantograph or wheel passes the release contactor the locking solenoid is energized, the bolt withdrawn from the control lever and the signal-indicating circuit opened.



Contactor for throwing and locking switch for Southern Pacific cars. One runner of this contactor is broken, allowing two separate circuits to be closed as the pantograph passes under the contactor



Contactor for trolley wheel is protected by runners which are placed on the wire to lower the passing pantographs and permit them to run by without closing the signal circuit



A green light in this signal indicates that switch has been properly lined up and locked for straight track. A yellow light indicates that switch is set and locked for diverging route

All of the operating mechanism is placed in the street and covered by heavy steel plates. However, the manual unlocking and locking levers are placed so as to be accessible to the train crew. In this installation it was necessary to specify the type of equipment to be operated over the switches and the number of cars in a train. Contactors for the Southern Pacific cars are located 151 ft. ahead of point of switch, requiring that the Southern Pacific train, if a single car (72 ft. 4½ in.), must have the pantograph on the rear end, while a two-car train must have the motor car on the forward end and the pantograph at the rear of this car. As the traction system operates only single cars with trolley pole at the rear these precautions were unnecessary.

Ohio Companies Increase Returns from Freight Hauling

THAT interurban electric railways are increasing their revenue from freight hauling is evidenced by the reports submitted by these companies to the Public Utilities Commission of Ohio for the past year. These reports show that the total freight revenue of these companies was $5,780,000, an increase over the year before of more than $1,000,000, according to the Ohio Committee on Public Utility Information. City, suburban and interurban electric railway companies last year carried 865,921,782 revenue passengers, which showed that the electric railway as a means of mass transportation in cities and means of travel between Ohio communities is exceedingly popular.

In order to improve their rolling stock and other equipment the electric railway companies of Ohio last year increased their investment by almost $42,000,000. These companies now have an investment of $357,955,000. Last year the electric railways of the state paid out $5,264,578 in taxes, and in addition $56,709,976 in operating expenses. The operating expenses increased over the year before by more than $2,250,000. The track mileage of these companies totaled 2,882.

Revenue Increased by Co-ordination of Bus and Car Service

Route Changes Recently Made by Public Service Railway Have Eliminated Duplication in Harrison and Kearny—Transportation Is Furnished to Additional Territory

MARKED improvement in the local transportation facilities in the towns of Harrison, Kearny and Arlington, N. J., has resulted from a recent change in the routes of buses operated by the Public Service Railway. The territory within the boundaries of these three municipalities really constitutes one continuous residential community adjacent to the city of Newark, which lies across the Passaic River. Car service is given by two lines, Nos. 35 and 39 (Kearny and Harrison by name), which operate over the same track on Broad Street, Newark, and on Kearny and Midland Avenues, Kearny, diverging only for a short distance where they cross the river by different bridges. Two bus lines also serve the same general territory. The Kearny bus line, No. 36, formerly followed the route of the Kearny car line practically from end to end. The Davis Avenue bus line, No. 40, operates parallel to Kearny Avenue two blocks away to the east. An accompanying map shows the relative locations of these routes.

It was felt by the management that operation of cars and buses over the same route on Broad Street, Newark, and Kearny and Midland Avenues was an uneconomic duplication of service. After consultation with the local

Davis Ave.
KEARNY
HARRISON

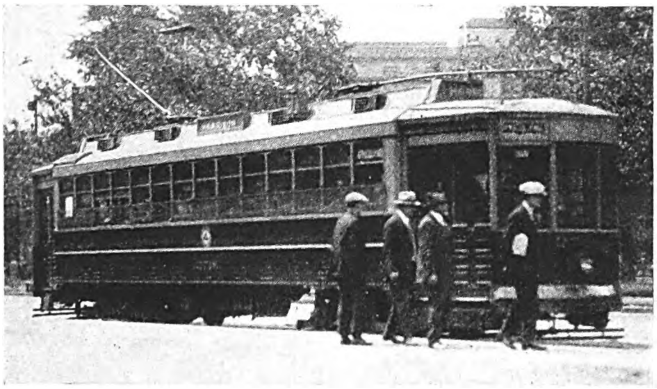
Rerouting of Public Service bus lines in Kearny has eliminated duplication of service and provided transportation facilities in new territory

municipal officials it was decided to reroute the buses to Belgrove Drive, a street approximately parallel to Kearny Avenue, two blocks to the west. The headway was increased from five minutes to six minutes. This change was made on April 22, and on that date the Davis Avenue route was extended about ¾ mile and the headway shortened. As a result of these moves transportation facilities were given too much additional territory.

At the same time the company made substantial improvements in its car service in these towns. Formerly the Harrison line operated on a fifteen-minute headway all day, while the Kearny line operated only during rush hours. Removal of the buses from Kearny Avenue necessitated an increase in car service on that street. Each line now operates a twelve-minute headway all day, so scheduled as to give six-minute service everywhere except on the short section where the two lines follow different streets.

Cars of a semi-de luxe type have replaced those formerly used. Fifteen of the company's most recent city cars have been equipped with leather-upholstered, individual seats and linoleum floor covering. They have been painted a bright red to distinguish them from the other cars, which are yellow. In general the remodeling process was similar to that of cars on the Bloomfield line of Public Service Railway as told in ELECTRIC RAILWAY JOURNAL Jan. 22. Sufficient cars have been renovated to equip completely both the Harrison and Kearny lines.

Since the new routing has been in effect, riding has decreased on the Kearny bus line, as was anticipated, and has increased on the two car lines and the Davis Avenue bus line. The net result has been a gain of about 2,400 passengers per week. This is expected to become more noticeable as the additional territory now being served for the first time builds up and produces more passengers. Already a score of new houses are being constructed along Belgrove Drive. This separation of car and bus lines to serve different districts instead of duplicating service in the same district is regarded by the company as an important step in the development of co-ordinated transportation.



The Kearny and Harrison lines of Public Service Railway have been completely re-equipped with semi-de luxe cars of this type

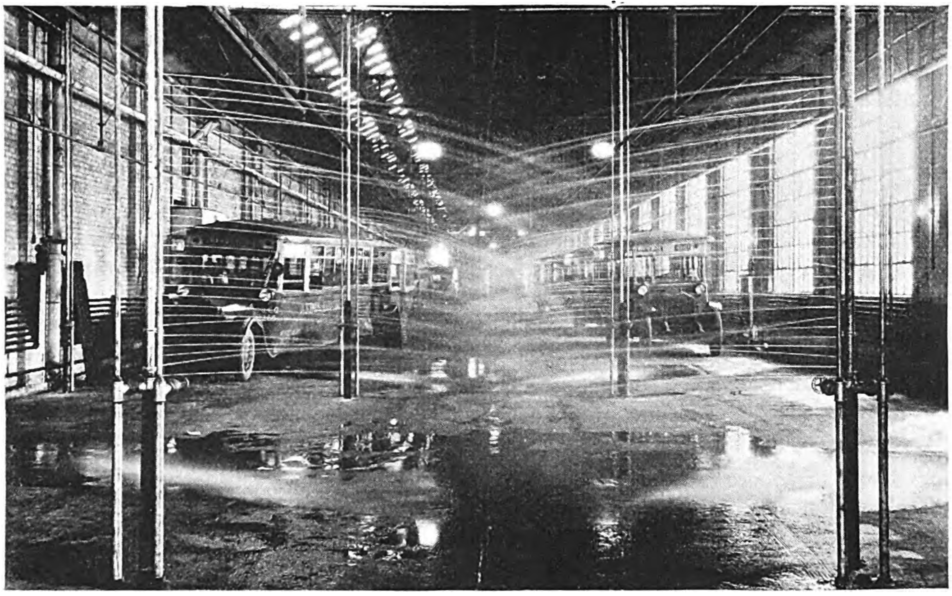
Convenient First Aid Packet

ONE of the interesting exhibits at the joint session of the Southwestern Geographic Division of the National Electric Light Association and the Southwestern Public Service Association held in New Orleans April 26 to 29, inclusive, was a first aid packet recently adopted by the New Orleans Public Service, Inc. The packet is used on emergency trucks and its use will be extended to all electric cars of the company. The materials which are included and the arrangements of the packet were originated by one of the department heads of the railway.

FIRST AID PACKET
Vaseline
WHITE
GAUZE BANDAGE
ROOM

Assortment of first aid material included in packet as used by the New Orleans Public Service, Inc. Instructions for use are included inside the cover

The various materials are included in a tin container which is absolutely dust and moisture proof. Particular attention has been given to the selection of materials so that they will provide everything necessary for first aid treatment of minor accidents and still not include any needless material or material which will be used infrequently. The packet contains two 2-in. bandages, one No. 2 tube of white vaseline, 1 yd. of plain gauze, one package of three swabs of mercurochrome, one yard of 1-in. adhesive plaster and a pair of surgeon's scissors. The total cost of the packet as furnished the railway is $1.16.



Arrangement of pipes for spraying buses

Keeping Cars Attractive at Small Cost

Frequent painting, use of spray methods where possible, efficient apparatus so that cars can be washed daily and a definite program to adopt improved devices have produced good results in Akron

By Pierre V. C. See

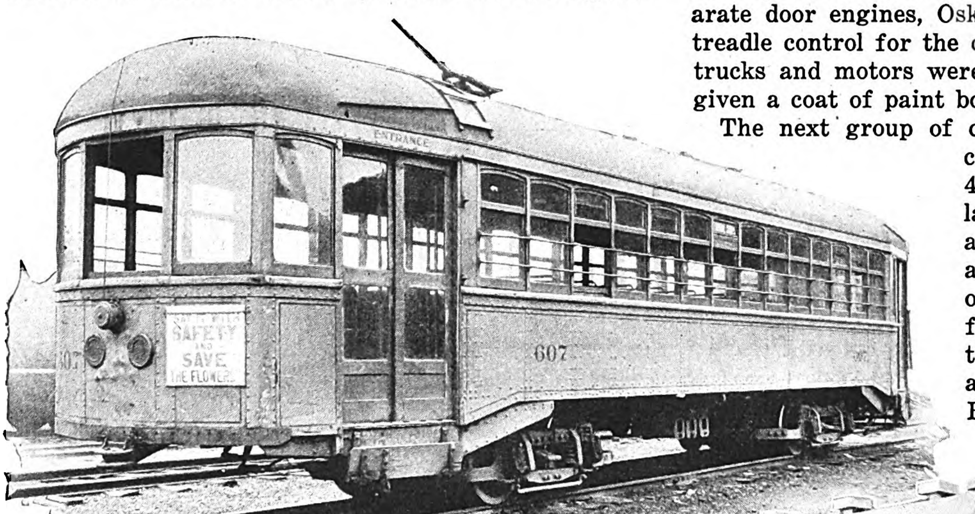
Superintendent of Equipment Northern Ohio Power & Light Company
Akron, Ohio

MEN of any railway directly responsible for the maintenance of rolling stock are anxious to keep the equipment in the best possible shape and running smoothly. They realize that clean, well-painted cars are a necessity, but when the management finds it desirable to reduce the budget usually the first expenditures cut are those for painting and cleaning. The theory seems to be that a car will run just as well clean or dirty. However, in this the sales value of attractive rolling stock is not considered. This tendency to pare down expenditures for painting and cleaning results in the mechanical department having but a very limited amount of money to spend for this work. So in order that the entire equipment may appear at its best it is necessary to study the situation carefully and to do the work on each car as cheaply as possible so that all cars may be kept in about equal condition and in as good shape regarding painting and cleaning as the money will allow.

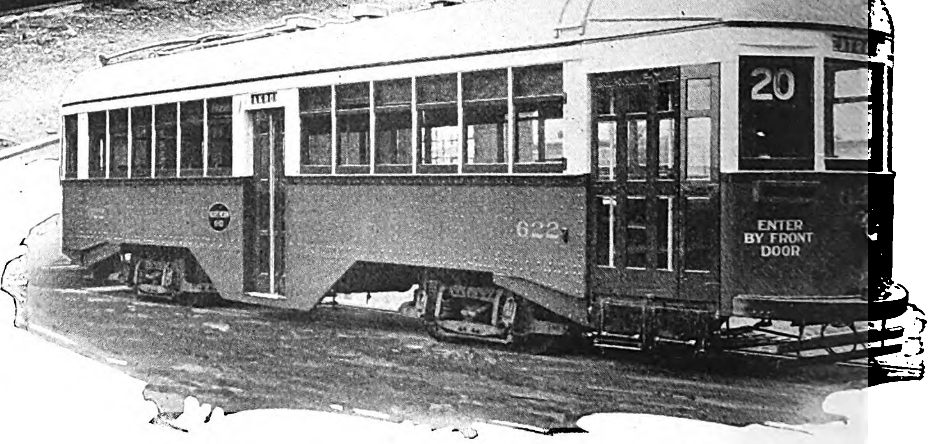
Passing a bus through the spray in its daily washing

Paint does not get the close scrutiny on cars that it does on automobiles, pianos or house furniture. Cars are usually viewed by people from the sidewalks and small defects are not noticeable. Foremen painters should be taught that while they may wish to turn out a highly creditable, well-finished piece of work the management considers such an expenditure unwarranted. The foreman painter must be trained not to remove sound paint from a car being refinished just because it is chipped or broken in places. A coat must be applied over the old paint and no time should be wasted in puttying operations, glazing or sanding small spots and crevices. Of course all rust and scale must be removed and bare spots primed properly.

Spray methods of painting should be used as far as practicable. For frequent repainting of cars it is unnecessary to remove the sash if the spray is used only for the flat surfaces below the belt rail. In an economy campaign the painting of parts which necessitates the installation of guards or extreme precautions to keep paint from adjacent parts does not appear advisable. The practice of spray painting trucks frequently might also be questioned as the cleaning off of trucks and the spraying keep them looking fresh for but a few days. The use of transfer numbers, letters and monograms often results in a very considerable saving on the year's painting cost.



One of the double platform cars before remodeling



Remodeled car provided with center door

Where the allowance for car cleaning is limited and the number of cleaners has to be kept as low as possible, some efficient type of water spray system will be found of advantage. The usual method is to install this either at the entrance to a shop or at some point in the yard where the cars can be brought through the spray without undue switching. With an effective system two men can make a very creditable showing in the cleaning off of the outside and windows of cars with a very small expenditure.

An accompanying line drawing shows the car and bus washing system as laid out at the Kenmore shops of the Northern Ohio Power & Light Company. Two other illustrations show the equipment as installed. The practice at Akron is first to wet the car thoroughly by the spray and then to have one man on each side rub the parts with a brush. The car is then passed slowly through the spray a second time for rinsing.

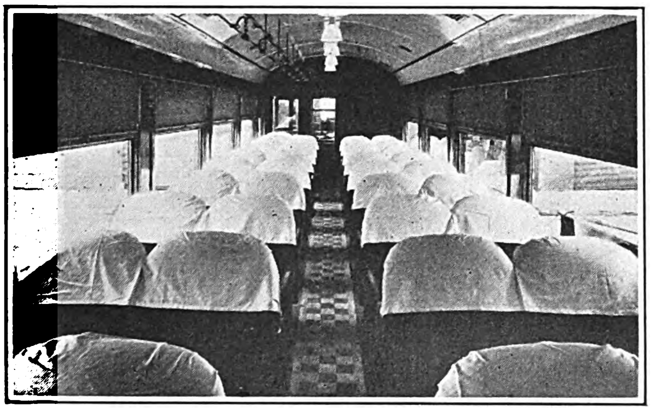
Conforming with the present movement throughout the electric railway industry to provide more attractive rolling stock with greater comfort and conveniences, the Northern Ohio Power & Light Company during the past year started a campaign to get all of the equipment which it operates into as good condition as possible without undue expenditure of money. This campaign not only included the improvement of appearance and addition of comforts in cars, but also provided for economies and improvements in operation. It was planned to complete the work of car rehabilitation by March, 1927. Some of the improvements which have been incorporated are given.

At present 74 Peter Witt center-door cars are used for operation in the city of Akron. These cars are all of a steel, semi-lightweight modern type. In the remodeling program these cars were converted for one-man operation by the addition of safety appliances, separate door engines, Oskelite equipment and automatic treadle control for the center door. At the same time trucks and motors were overhauled and each car was given a coat of paint both inside and out.

The next group of cars on which remodeling was carried out included a series of 41 composite city cars with very large rear platforms. The cars are fifteen years old, but they are well built and in a good state of preservation. It was therefore felt advisable to rebuild them rather than to scrap them and purchase new equipment. For the sake of uniformity, it appeared most desirable to make them as nearly as possible like the Peter Witt cars so that there would be less confusion on the part of passengers where both types of cars were used. With this group of cars the front-entrance door was enlarged by moving the corner post forward and by taking away the panel between the door and car body so as to make a comfortable entrance. An emergency exit was provided and arranged for operation by a separate door engine. Full safety devices and all other appliances as used in the Peter Witt cars were installed. A center door was cut in the side of the car. As the floor of this type was higher than in the Peter Witt cars it was necessary to use three steps. All the steps were arranged to act as treadles for controlling the door. The long rear platform was cut off 3 ft. and was buil up level with the rest of the car. A circular seat wa then installed around the rear end. The rattan seat with which the car was equipped were padded thoroughly and covered with imitation leather. Inside and outside were painted carefully and the ceilings were given a high gloss white enamel.

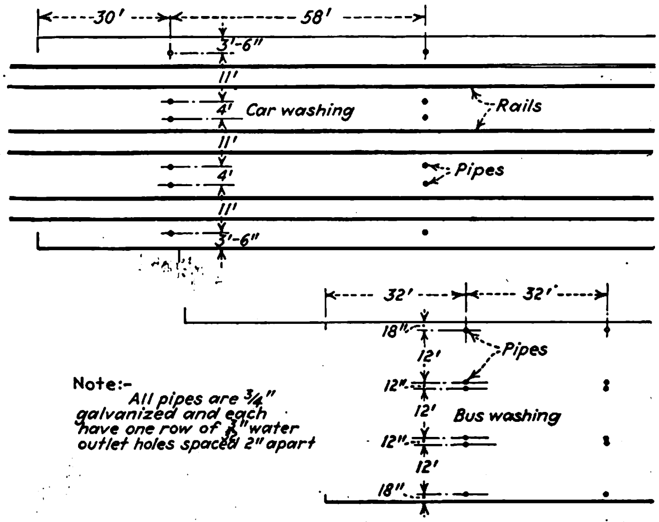
While this body work was being done the trucks were overhauled, the gear ratio of the motors was reduced and helical gears were installed. In rehabilitating the motors the bearings were welded electrically and rebored. New housings and bearings were installed where necessary. With this change in equipment the car was provided with a faster pick-up and much quieter operation.

In Canton the Peter Witt cars have been equipped in the same way except that the treadles were not installed as the service was much lighter and treadles were not deemed necessary. Other cars used in the Canton service are of steel. These were converted for one-man operation by building up the rear platform and remodeling the front vestibule similar to the cars in Akron. Each car was painted during the process of alteration.



Interior arrangement of seats in chair car with linen covers

The interurban cars operated by the Northern Ohio Power & Light Company were given either a coat of varnish or a coat of color varnish and varnish, depending upon their condition. The interiors were freshened up with white enamel. As an experiment two cars were arranged for the installation of chairs. One of these was shown at the American Electric Railway Association convention in Cleveland last October. These chair cars have been running since the convention in regular service and very favorable comment has been received.



Arrangement of wash tracks at Kenmore shops

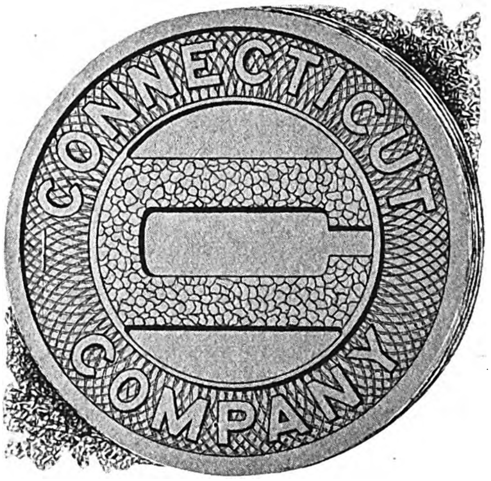
The campaign for better appearing cars has also been applied to the freight equipment operated by this company. Most of the freight cars have now been sprayed with paint so as to present an attractive appearance.

Clean and Beautiful Station Surroundings Win Awards

MINDALE and Union, stations on the northern division of the Illinois Traction System between Peoria and Springfield, Ill., have been awarded the grand prize for the best kept stations and grounds on the entire main division of this line. The grand prize was awarded to both because of the excellence of the conditions at both stations. The first prize of $35, the second of $25 and the grand prize of $65 were added together, and the total divided between these two stations. Third prize on the northern division goes to Danvers. On the central division, Harristown carried off first prize, on the eastern division Fithian, while on the southern division Gillespie was first. It was at the request of D. W. Snyder, Jr., vice-president of the Illinois Traction, that an inspection of the stations was made and recommendations for awards forwarded to him.

Where Connecticut Tokens Go

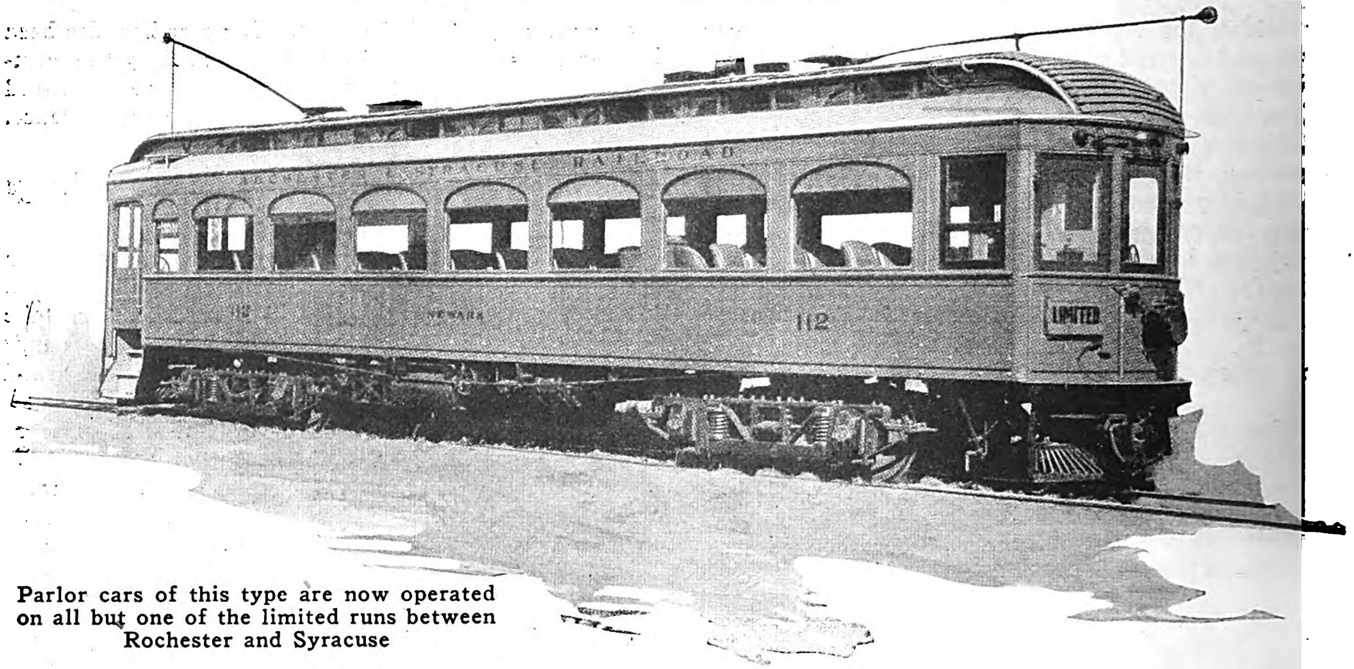
FACTS about the street railway are told in a booklet distributed by the Connecticut Company at the recent progress exposition held at New Haven. A historical sketch is given of the organization and development of the transportation system, and a statement of how the company's revenue is spent. To emphasize this the booklet has been made circular in shape, with covers that resemble a token, as shown in the accompanying illustration. Distribution of expenditures was shown as follows:



Booklet giving information concerning the Connecticut Company, made up to resemble a trolley token

Wages	$7,800,000
Supplies	1,500,000
Coal	600,000
Purchased power	600,000
Contract work	500,000
Accident claims	360,000
Taxes	490,000
Interest	400,000
Dividends	None

This booklet proved extremely interesting to the public, as indicated by the small number which were discarded.



Parlor cars of this type are now operated on all but one of the limited runs between Rochester and Syracuse

Rochester & Syracuse Cars Made More Attractive

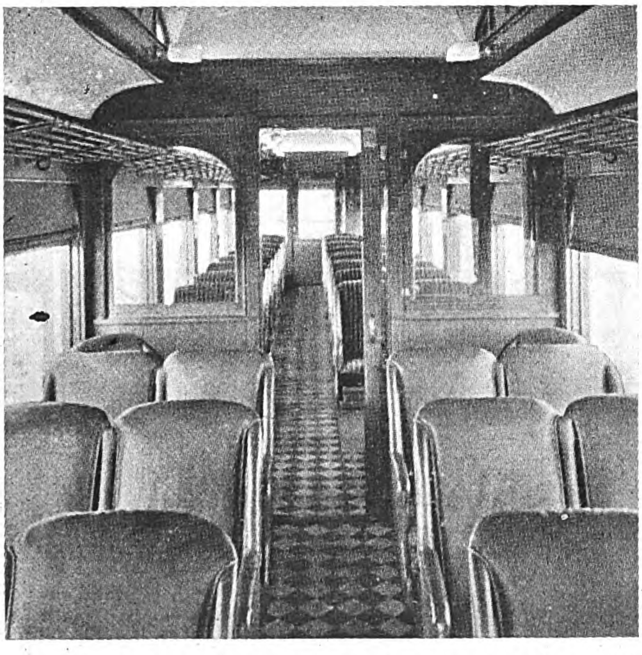
FIVE cars in limited service on the Rochester & Syracuse Railroad recently have been refitted with the object of making them more attractive to passengers and thereby encouraging riding. The car bodies are not new, but were completely rebuilt in 1923, and have been refinished. They are of the semi-steel type. Trucks have been thoroughly overhauled so as to improve greatly their riding qualities.

It is in the interior, however, that the greatest improvement has been made. In the main compartment the chairs are finished in leather and striped velour and are arranged in pairs on one side of the aisle with single chairs on the other. At the ends are other single chairs. In the smoking compartment the chairs are finished in leather and are arranged in pairs on each side with single chairs at one end. All chairs are deeply cushioned with heavily padded backs.

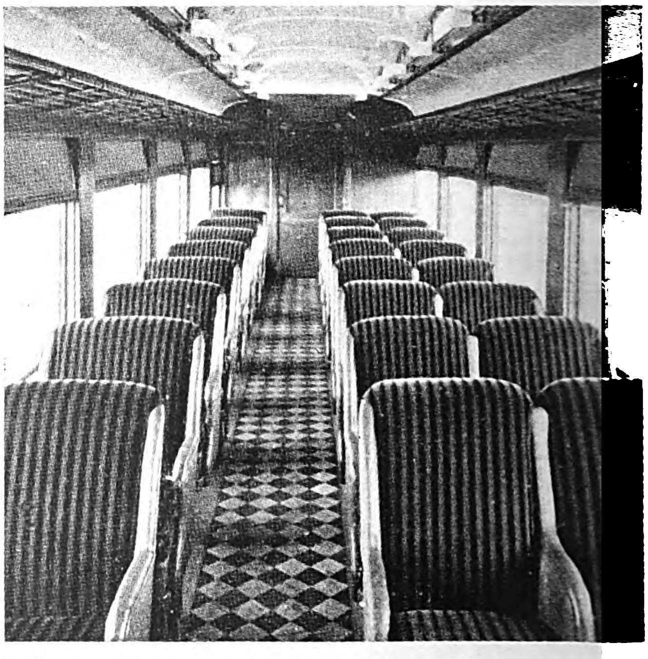
Five-foot plate glass windows materially improve the visibility and add to the attractive appearance of the car. The lighting system has been much improved by the installation of frosted bulbs and artistic shades. New baggage racks have been installed. The interior is finished in a soft dark gray color, harmonizing well with the gray leather and maroon gray striped velour chair covers.

The floorcovering is of rubber tile. This has had an important effect in reducing noise. Other noise has been eliminated by doing away with fare register apparatus, swinging bell cords, etc.

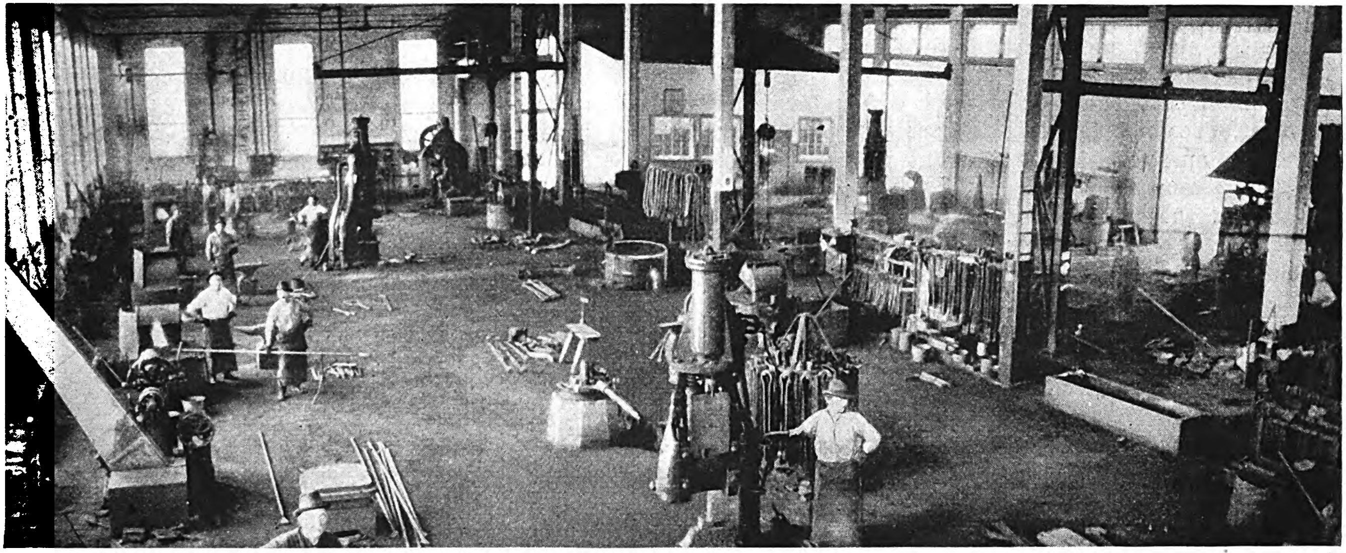
The first car was completed and put in service during the latter part of February.



In the smoking compartment the seats are upholstered in leather and are arranged in pairs on both sides of the aisle



In the main compartment seats upholstered in maroon and gray striped velour are arranged in pairs on one side of the aisle and singly on the opposite side



The walls of the blacksmith shop are sprayed periodically with white paint so as to give a clean appearance

Los Angeles Railway Shops Modernized

Machine tools have been changed over to individual motor drive and modern switching equipment has been installed. Particular attention has been given to provide a light, neat shop

AN EXCELLENT example of how an existing shop can be modernized is to be found at Los Angeles, Cal., where the railway company has in the last few years reconstructed its shops to a point where they compare favorably with plants built within the last few years. All machine tools, both in the machine shop, woodworking department and truck group, have been converted from belt drive to individual electric drive. The various departments have been spread out, for which purpose the shop buildings have been increased in size and new sections have been added.

All of this modernization of shop equipment has had its effect on the reduction of the cost per mile for maintaining the 750 cars of the system. As a result many improvements have been made in the rolling stock itself, since it is now possible to do this at a cost which makes it practical and economical.

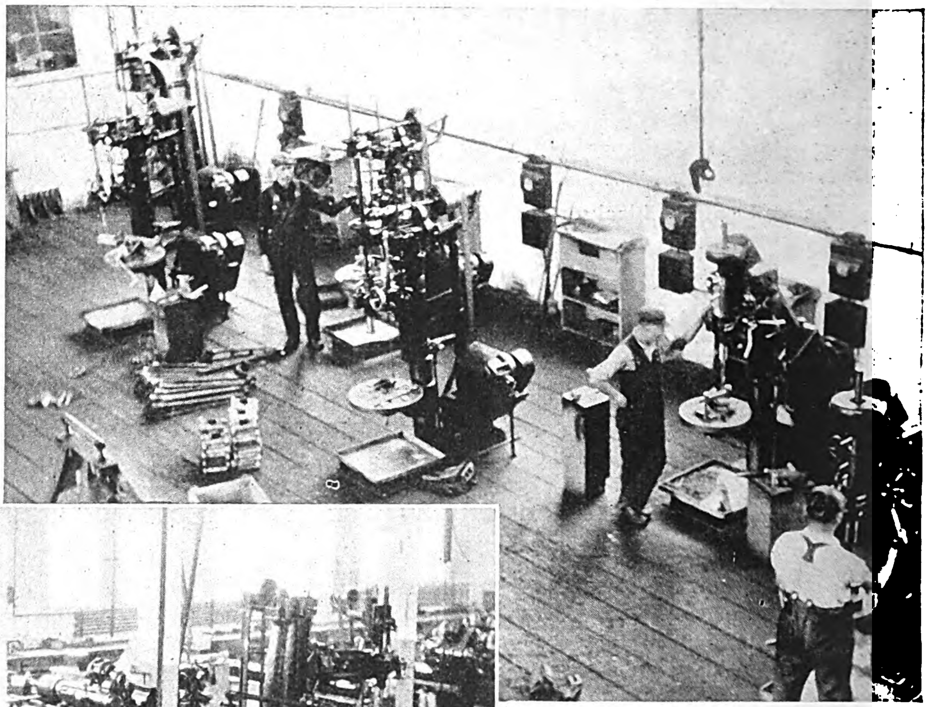
The armature and electrical department of the Los Angeles Railway is clean and orderly with an abundance of air and light. In this department are handled armature rewinding, field coil rebuilding, dipping and baking of armatures and other phases of electrical maintenance.

The armature and electrical department of the Los Angeles Railway affords an example of cleanliness and orderliness

The blacksmith shop of a railway is usually the skeleton in the closet and as a rule does not lend itself to inspection by outsiders as an example of orderliness and cleanliness. The shop at the Los Angeles Railway, however, does not fall into this category. The walls have been sprayed with white paint and are kept clean by going over them periodically. The floor is swept clean, and the hand tools and materials are kept in order. Heavy steam hammers, bulldozers and cut-off machines are part of the mechanical equipment. Everything is available in the way of tools and machinery for complete construction of body and truck frames, and if necessary the company could build its own complete cars.

A portion of the machine tool room is fitted with lathes, drills and other pieces of equipment. This company has two porters on duty at all times washing the shop windows, which permits the large glazed areas to be utilized to full advantage.

Because of the large floor space available one room has been devoted entirely to drill presses and in this all of the drilling work for the system is performed. The arrangement of the individual motor-driven drills along the glazed side walls forms a striking feature. Fuse and switch boxes are installed on the walls, 440-volt, three-phase alternating-current power being used for all shop drives.



One room is devoted entirely to drill presses for this class of work

The machine tool room is provided with a large glazed wall, insuring ample light

Crossing Accidents in Milwaukee Reduced

NOTABLE success has been achieved by the Milwaukee Electric Railway & Light Company, Milwaukee, Wis., by reducing crossing accidents through the introduction and operation of flashing red light signals hung over intersections along electric railway lines, warning motorists that there is a street car crossing at that point. The warning lights were installed in 1925. Previous to their installation accidents in which street cars figured averaged 7.7 per month on 100 crossings. Today, with about 400 of these signal lights in use throughout the city, the accident curve at crossings has fallen off about 36 per cent, or about 4.9 accidents per month on 100 crossings. These beacons of safety, which flash a danger signal 30 times a minute, are one of the company's own creations. The equipment used for this purpose is produced in its shops.

$1,823 in Sick Benefits at Buffalo

APPROXIMATELY $1,823 was paid to members of the International Railway Co-operative Association, Buffalo, N. Y., in sick benefits in 1926. Two pension applications were also approved by the Co-operative Association, each member of which is insured for $1,000. About $13,000 was paid to families of members who died during the year. This information was contained in a report of George L. Burgain, retiring president of the Co-operative Association, showing that 99.68 per cent of all eligible employees were enrolled. The report also shows that employees of the company have an investment in bonds and stocks totaling $2,160,400 par value, plus $50,000 par value investment of the association. The co-operative saving fund now numbers 1,000 depositors, their deposits totaling about $100,000.

The association elected William E. Murphy, chief dispatcher and a director of the company, president of the employees' organization. Mr. Murphy had been vice-president and in September, 1926, was elected to the board of directors of the company. The vice-presidency of the employees' organization will be filled by H. P. Lesswing of the power and line department.

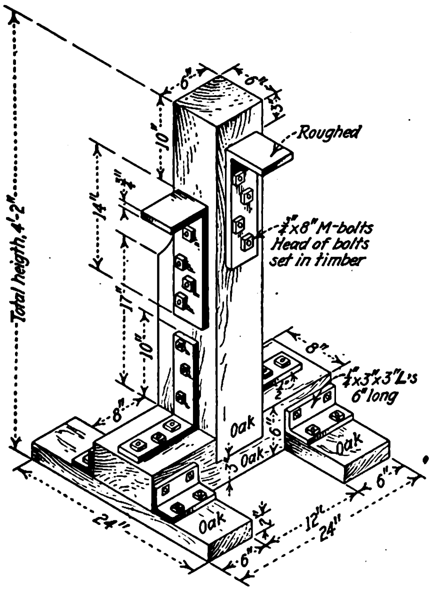
Capitalize Your Experience

See the Maintenance Competition announcement on page 1048.

Maintenance Notes

Convenient Support for Car Body

SATISFACTORY support for a car body while the trucks are removed and undergoing repairs is a problem that has been solved in the shops of the New Brunswick Power Company, St. John, N. B. With the old method of using steel drums with improvised cross-members such as track rails, timbers and blocking for supporting car bodies considerable inconvenience and difficulty were experienced. The steel supports on which the sills of the car rest are arranged at different heights on two sides of the upright, so as to provide for different conditions. The base is made of oak timbers 2 ft. long by 6 in. x 2 in. A cross-timber provides the support for the upright, which has a total height of 4 ft. 2 in. L-shaped steel braces reinforce all intersections. This type of support provides increased flexibility for height and is of particular convenience for workmen to work around. When not in use the stands can be stored in a very small space.



Car supports as used by the New Brunswick Power Company

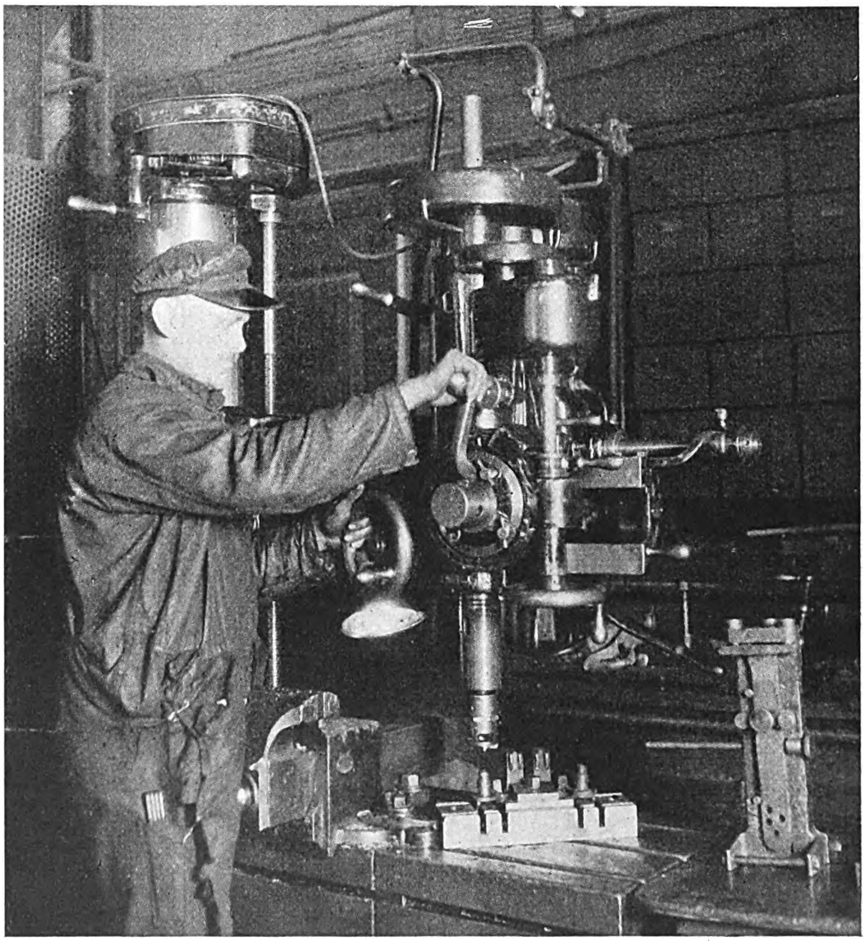
Four of these are used for each car set. Their total weight is but 130 lb., which makes handling easy. The practice of the New Brunswick Power Company is to paint these supports a bright red, which gives them high visibility, and also suggests to the workmen that they should be used with care. The iron work is painted black.

Triple Baking Prolongs Armature Life

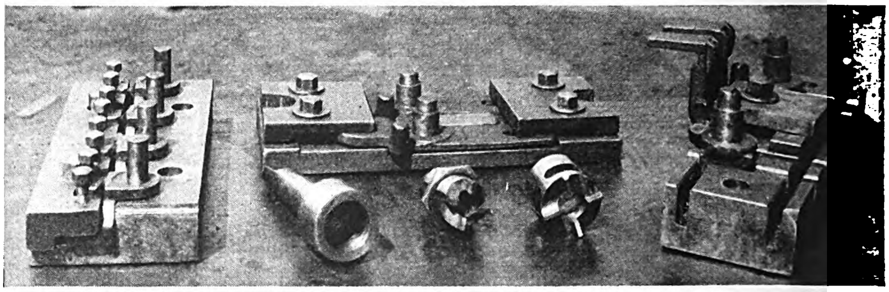
FAILURE of armatures and field coils on the cars of the Atlantic City & Shore Railroad, Atlantic City, N. J., have been greatly reduced in recent years since the adoption of dipping and baking. A feature of this process on which much stress is laid by J. W. Gordon, master mechanic, is that it is carried out three times. When a motor is overhauled, the armature and all field coils are removed and heated in oven to 170 deg., then dipped in Chinalac for 30 minutes. They are then baked at a temperature of 170 deg. F. for four hours. After that they are again submerged and baked for the same period. The process is repeated once again before they are replaced in the motor case.

A Duplex Hollow Mill

FOR facing two shoulders and turning two bodies to different diameters at the same time a duplex hollow mill designed and constructed by the shop men is used in the 39th Street repair shops of the Brooklyn-Manhattan Transit Corporation, Brooklyn, N. Y. It has a variety of uses, such as the machining of lugs on bell cranks and brackets used for the gates of elevated cars. The cranks and brackets are of unusual shape and are very troublesome to machine, if held in an ordinary lathe chuck. An accompanying illustration shows several



Finishing gate castings with duplex hollow mill of these gate brackets set up in a jig which holds them in position for machining, which is done with the hollow mill. In addition to facing off two shoulders of these castings, the upper portion has to be turned to a diameter of ¾ in. and the lower section to a diameter of 1 in. The tool has cutting surfaces so that all of these parts are finished in one operation.



The three parts of the mill are shown in the center, while jigs holding castings to be finished are shown at either side and in the background

The duplex hollow mill is thus four tools in one, two of which are used to finish the faces of the shoulders and the others to turn the round sections. The mill is made in three parts. One, shown at the left in the illustration, forms a holder for the two others and can be placed in a drill press in the same manner as a taper drill. The two other parts fit into the holder, one passing over the other. The center part slides onto the holder and is held from rotating by a key. The part at the right fits into the center part and has a keyway and set screw for fastening. The nut which may be seen on the center part regulates the distance with which the cutting edges are held apart. Means are also provided for longitudinal adjustment of the cutting edges so that grinding may not interfere with the desired setting of the tool.

It will be appreciated that with this kind of hollow mill, with the jigs shown, the time for doing the work is decreased enormously and also when the castings are machined an accurate fit is obtained and the various castings are uniform so that they are interchangeable.

A Winner

Announced Next Week

First	$200
Second	$100
Third	$ 50

Monthly Prize
$25

THE first monthly prize winner in the maintenance competition will be announced in next week's issue of ELECTRIC RAILWAY JOURNAL, dated June 18. The second installment of articles submitted in the contest will also appear. This competition is attracting widespread interest, and winners of the various prizes can feel proud of the distinction of having submitted a winning idea. All material received has been of a particularly high grade and the practices described are saving money for the railway properties which use them. The prominence given to such time and labor-saving methods or devices is sure to result in increased use and also to the development of similar practices which will prove of benefit to the systems on which they originate.

Many general managers have recognized the value to their men of these glimpses of successful practices that ELECTRIC RAILWAY JOURNAL is giving in its Maintenance Data Sheet section. They see that the descriptions get to the men who can profit most and so improve their own maintenance methods. They also see that they are filed properly so as to be available at all times and so constitute a Bible of Maintenance Methods. Heads of maintenance departments are also encouraging their men to submit ideas that can be sent in for the prizes.

One railway official wrote:

"I have interested all of our maintenance departments in this competition, with the understanding that any money received as payment for the articles or as prizes will go into a jackpot fund for an open-house inspection and celebration some time later."

Condensed Rules for the Contest

Any employee of an operating electric railway or electric railway bus subsidiary may compete for the prizes to be given by ELECTRIC RAILWAY JOURNAL for short maintenance items. Full information is given in the April 16, 1927, issue, pages 700-701.

The author does not necessarily have to be the originator of the idea or device. An article may be submitted by several persons or by a department and need not be written by the person in whose name it is submitted.

Articles may treat of any maintenance practice or device used by any department of an electric railway and should be preferably 100 to 200 words in length and accompanied by one illustration. Brevity consistent with a proper presentation of information will be given weight in judging articles. In no event should they be longer than 400 words with more than two illustrations.

Manuscripts should be mailed to the editor of ELECTRIC RAILWAY JOURNAL, Tenth Avenue at 36th Street, New York, N. Y. To be eligible for the capital prizes, the envelope must bear a postmark dated before Aug. 1, 1927.

In addition, a prize of $25 will be awarded each month. The first group of articles submitted was published in the Maintenance Data Section of ELECTRIC RAILWAY JOURNAL for May 21, 1927.

If sketches accompany the manuscripts they may be in pencil, or blueprints will be accepted. Each item submitted should bear the name or names of the individual or individuals by whom it is submitted and to whom awards are to be made.

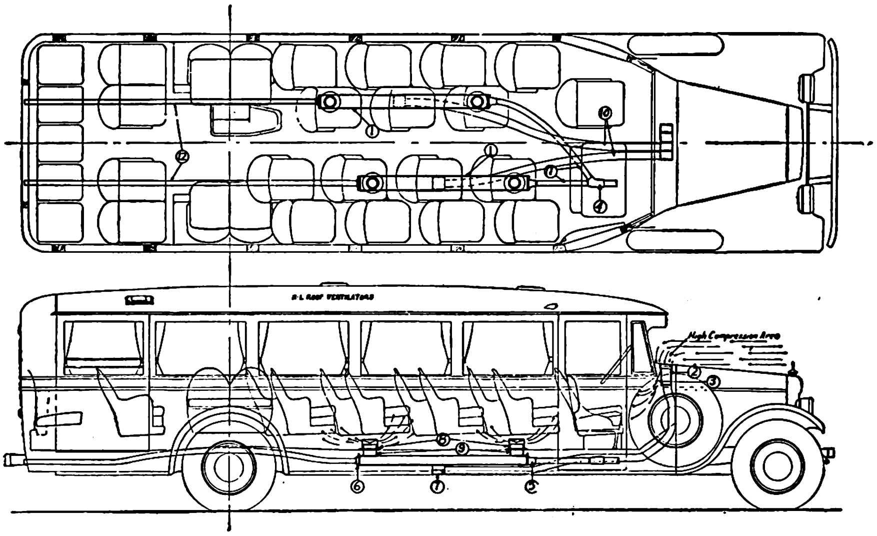
The announcement of the winner of each monthly contest will be made in the issue devoted to maintenance and construction, the third issue of the month, following the one containing the item.

The winners of the capital prizes will be announced in the Annual Convention Number of ELECTRIC RAILWAY JOURNAL, to be published in September, 1927.

New Equipment Available

Venti-Duct Heater

AMONG the advantages claimed for the N-L Venti-Duct heater recently placed on the market by the Nichols-Lintern Company, Cleveland, Ohio, are that a sufficient amount of heat is provided at zero temperature to make the coach comfortable at any speed; that increased ventilation is produced with even temperature throughout the coach; that fire hazards are eliminated; that obnoxious gases are avoided and the cleaning problem is reduced.



Circulation of air with new Venti-Duct heater

An all-weather cowl ventilator collects the air at high velocity and pressure at a point that insures against contamination from the engine. The force available gives a maximum heating effect. The highest degree of cooling of the cowl is provided as it operates regardless of weather conditions. This ventilator for the bus cowl was described in ELECTRIC RAILWAY JOURNAL for Dec. 4, 1926, page 1014.

Air passes to the heaters through a 3-in. flexible tube or its equivalent. It divides at this point and passes along the heater tubes in both directions. At each end of the heating chamber is an opening into the body having a diameter of 5½ in.

The exhaust line is split with a heavy cast Y and the exhaust is carried to the heater with a minimum of turns. As the heater is used as a muffler, exhaust heater valves and mufflers are eliminated. The outer casing of the heater is constructed of No. 20 gage cold-rolled steel. The exhaust passes through 1-in. seamless steel tubing brazed into heavy steel headers. The exhaust on passing through these tubes is cooled rapidly by the air passing over them and then passes out of the heaters to the rear of the coach.

Development in Two-Pole Switches

TWO-POLE switches with solid neutral block for use on three-wire grounded systems have just been developed by the Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., in sizes running from 30 to 600 amp. This design of switch provides an economic arrangement to utilize the advantages of reduced size made possible by using solid neutral without the third switch blade, the size being reduced to that of a standard two-wire switch.

The 30-amp. size switch is of the "00" type, the 60, 100 and 200-amp. sizes of the WK-62 type and the 400 and 600-amp. sizes of the WK-60 type. All the types up to 200 amp. may be supplied with end or removable end adapted to a meter trip when it is desired to mount the meter in conjunction with the switch.

"Eventually, Why Not Now"
Use heat-treated bolts.

Boom Extension for Railway Ditching Machine

BECAUSE the railway ditching machine of the American Hoist & Derrick Company, St. Paul, Minn., is used extensively as a crane for handling rails and other materials, the makers have introduced a boom extension to facilitate handling of the 39-ft. rails now laid by a number of railways. This boom extension is composed of two 10-in., 20-lb. steel channels, 9 ft. long, braced with angles and channels. Beyond the main boom the 9-ft. channels are inclined together so as to give the proper clearance for the end sheave. After the dipper handle has been removed, the extension is bolted to the underside of the main boom, the attachment being arranged to provide for ready placing and removal.

This machine, whether used as a ditcher or crane, travels on a portable track on the floor of a flat car.

The boom extension facilitates handling of 39-ft. rails

Association News & Discussions

Winnipeg Welcomes Canadians

Enthusiastic Three-Day Meeting Held by C.E.R.A. Includes Many Operating and Maintenance Subjects

WINNIPEG, the capital of Manitoba and the midwestern metropolis of Canada, provided a right royal welcome for the Canadian Electric Railway Association last week. As guests of the Winnipeg Electric Company, the most representative body of operators assembled in the 23 years life of the association. Three morning sessions were held, on Tuesday, Wednesday and Thursday, May 31, June 1 and 2, followed by luncheons at which topics of interest to the members were presented. The afternoons were devoted to inspection of exhibits. On Tuesday and Wednesday evenings dinner dances were held at the Fort Garry Hotel. A total of nearly 200 members and guests were registered.

Tuesday morning's session was devoted to routine business and reports of committees. Four companies, the Newfoundland Light & Power Company, the Edmonton Radial Railway, the Saskatoon Municipal Railway and the Calgary Municipal Railway, were elected to membership, bringing the total up to 36 companies.

In his opening address President W. R. Robertson presented statistics showing the vastness of the empire and indicating the magnitude of the transportation problem. "In Canada today," he said, "we have more than 2,500 miles of electric railway, more than 40,000 miles of steam railway, 470 miles of canals and more than 210,000 miles of highways. Of the highways 25,265 miles are graded, more than 48,000 miles are gravel, more than 4,000 miles are macadam and more than 3,500 miles are paved. It is estimated that the investment in highways is in the neighborhood of $600,000,000 to $800,000,000.

"The investment in motor vehicles and horse-drawn vehicles is estimated in the neighborhood of $2,000,000,000, in steam railways $3,500,000.000 and in electric railways $221,769,000. The electric railways are carrying in the neighborhood of 725,000,000 passengers per year, or nearly double the number carried by all the other facilities. These figures show that in a country such as Canada, with its vast distances and its comparatively small population, there is a transportation problem faced by few other countries in the world today.

"The bus," said Mr. Robertson, "is having its field more clearly defined each year. While it is more apparent each day that up to the present time there is nothing which approaches the trolley car in over-all efficiency for the handling of mass transportation, the industry is waking up to the fact that the scope of its work is not confined alone to the operation of trolley cars, but also embraces many other fields of transportation, which formerly were either unserved or left to the haphazard control of small agencies.

"Notwithstanding that the ownership of motor cars in Canada has grown from 6,000 in 1910 to more than 820,000 in 1926, coincident with this growth electric railway revenue has increased from $17,000,000 to more than $50,000,000. Only two companies out of the 39 in Canada report a smaller revenue in 1926 than in 1925, although we have had to compete with jitneys, buses and trucks. There has been industrial depression and very small increase in population; in fact, many of the older sections show decreases. This situation justifies us in having the utmost faith in our industry."

Committees Present Reports

Discussion of committee reports showed the great interest being taken in many of the problems of today.

The report of the motor bus and truck committee, read by Mayor F. D. Burpee, Ottawa, in the absence of Chairman I. S. Fairty, stated that replies to questionnaires indicate that there have been few instances of actual discontinuance of bus routes, while on the other hand a substantial number of new routes have been established, and on the whole there is little bus competition with Canadian street railway lines. From 94 buses used by railway companies in 1925 the number increased to 202 last year. Many of the member companies have entered the local sightseeing business, with apparent financial advantage. This class of business coordinates well with other local services, giving employment to men and vehicles in off-peak hours.

"It is becoming more and more apparent," states the report, "that the operation of automotive vehicles by the transportation agency of any given area should not be confined strictly to the geographical boundaries of such area. For the street railway system to sit weakly by while others pre-empt all profitable interurban or suburban routes spells disaster in the long run. It involves a constantly increasing loss of local fares to such through-running buses, the creation of a network of outside franchises stifling and forbidding the normal growth and development of the local system, the occupancy by others of a field logically belonging to such system and necessary to the economical development of its urban services, and a substantial and pronounced loss of prestige and local favor."

A. H. Foster, Brantford, chairman of the committee on publicity and merchandising transportation, presented the report. This committee is preparing and disseminating information regarding electric railways along lines parallel with the American Association. Files are being built up by the secretary which will make available much valuable material hitherto unobtainable.

M. W. Wales, Winnipeg, read the report of the committee on rail corrugation for Chairman C. R. Kinnear. Tests are being made in conjunction with the corresponding committee of the American Electric Railway Engineering Association. In view of the lack of a solution the committee proposes remedial measures such as rail grinding. An abstract of the report will appear in a forthcoming issue.

Accident Prevention

W. R. McRae, Toronto, chairman, presented the report of the committee on safety and accident prevention. The apparent lack of interest in this subject was deplored.

A lively discussion followed. Mr. Robertson pointed out that the proportion of accidents increases with the car-miles operated, being most serious in the larger cities. Licensing of automobile drivers he feels is a means of reducing accidents. No person should be allowed to drive unless physically qualified.

That the one-man car has proved safer than the two-man car, due to the safety devices and undivided responsibility, was the evidence of the various speakers. Several roads have not yet had a single accident with the treadle door.

J. Metcalfe, Toronto, stated that the reduction in accidents on his system in the past six years has alone been sufficient to pay interest on the investment in safety car devices. In Toronto, he stated, every possible safety device is used. About 300 cars are run in the base hours and 900 in the rush. Of the latter total about 400 cars, including the trailers, are operated with one man. Treadle-operated one-man cars on this property number 150.

On this system it is not the practice to put a single safety car on a route to educate the public. A whole route is converted at once after preliminary advertising. A man rides the cars on the line and announces orally to the passengers the benefits of the new service.

It has been Mr. Metcalfe's experience that the treadle car with 80 to 90 passengers aboard will unload more quickly than any other type used in

America. No difficulty has been experienced when physically defective passengers alight.

C. H. Dahl, Winnipeg, stated that the boarding and alighting accidents on the treadle cars are far less than with other types operated in Winnipeg. An analysis has shown that 8 per cent of the trainmen are responsible for 25 per cent of the accidents. By eliminating some of these men the record has been much bettered.

D. E. Blair, Montreal, also stated that the treadle car is by far the safest of any type operated in that city. Treadle exits are used on 60 double-truck one-man cars and 100 trailers. Three or four slight accidents have been occasioned through the long flowing robes of nuns becoming caught, but there have been no injuries. In a few instances children have been caught when they were lifted off the treadle. No accidents have followed as the cars could not start.

R. M. Reade, Quebec, stated that accidents on one-man cars have virtually been eliminated. The accidents in Quebec average about one per 60,000 car-miles and the cost last year was 0.7 per cent of the gross revenue. The most dangerous accidents are collisions with automobiles turning out from the curb.

Mr. Robertson agreed with this last statement, based on his experience on the lines of the Ontario Hydro-Electric Power Commission. He also quoted figures based on results in the United States indicating that the one-man car is safer than the two-man car.

CAR MAINTENANCE RECEIVES ATTENTION

Wednesday's session opened with a lively discussion on car maintenance and noise reduction, led by Charles Comba, Calgary, and J. E. Watkins, Winnipeg. Mr. Watkins' paper will be published in a future issue.

Mr. Comba believes that spur gears are the greatest source of car noise. He insulates the gear cases by washers of leather webs.

Mr. Robertson states that he is obtaining an average of 100,000 miles from helical pinions. The gears probably will give 500,000 to 600,000 miles, although he has not as yet worn any out.

W. R. McRae, Toronto, agreed with Mr. Comba as to the noise of spur gears. He anticipates a life of 160,000 miles from helical pinions, although none have been removed. Major Burpee also is obtaining good results in Ottawa with helical gears.

J. F. Neild, Toronto, read a paper on the relative merits of various types of trolley wire. This is published elsewhere. With regard to life of wire, he stated that with a wheel pressure of 25 lb., No. 00 hard-drawn copper should be good for 3,000,000 wheel passes and tin bronze for 6,000,000 passes. Sag causes wear. In Toronto the practice is to stretch the wire as tightly as possible when it is strung in the coldest weather and let the sag come as it may in the summer.

E. V. Caton, Winnipeg, substantiated Mr. Neild's statements. The cadmium wire he has found to have a wear ratio of 1 to 1,654 in its favor as compared with hard-drawn copper.

A paper on economics in power distribution was prepared by A. J. Westman, Montreal. It was presented by A. S. Byrd in his absence. An abstract appears elsewhere. Manfred Freeman, Lethbridge, attested to the value of the mercury-arc rectifier, having the second one in Canada. Since it has been installed no trouble has been encountered, and the all-day efficiency has been increased from 50 per cent to 72 per cent. Mr. Byrd stated that the interference with telephones in Montreal has been eliminated and the telephone engineers are entirely satisfied with the use of the rectifier.

ENERGY-SAVING CAMPAIGNS SUCCESSFUL

D. W. Houston, Regina, told of a campaign which has been in force on his property in the past three years with the idea of saving one-fourth of the energy. As a result of intensive effort, the average cost during the past three years has been $118,348, as against $174,698 the year before the campaign was begun, a saving of 32 per cent.

Major Burpee stated that in Ottawa he has had good results with the younger men, while the older ones are hard to get in line. The record of each man in comparison with the average in his class is handed to him with the semi-monthly pay check. In several instances the records made have been so good that the lines have been speeded up, while at the same time accidents have been reduced as the cars are easier to stop.

COMING MEETINGS OF *Electric Railway and Allied Associations*

***June 13-16*—National Association of Cost Accountants, annual convention, Palmer House, Chicago, Ill.**

***June 15-16*—American Automobile Association, Motor Bus Division, Ritz Carlton Hotel, Philadelphia, Pa.**

***June 19-23*—International Street and Interurban Railway Association, annual conference, Copenhagen, Denmark.**

***June 20-24*—American Society for Testing Materials, 30th annual meeting, French Lick Springs Hotel, French Lick, Ind.**

***June 20-24* — American Institute Electrical Engineers, convention, Book-Cadillac Hotel, Detroit, Mich.**

***June 24-25*—New York Electric Railway Association, annual meeting, Hotel Champlain, Bluff Point, N. Y.**

***June 29-July 1* — Central Electric Railway Association, summer meeting, Book-Cadillac Hotel, Detroit, Mich.**

***June 30-July 1* — Tramways and Light Railways Association, annual meeting, Bath, England.**

***July 22-23*—Central Electric Railway Accountants' Association, Tuller Hotel, Detroit, Mich.**

***July 27-29*—Association of Equipment Men, Southern Properties, 12th semi-annual meeting, Atlanta, Ga.**

***Sept. 8*—Central Electric Railway Master Mechanics Association, South Bend, Ind.**

***Oct. 3-7*—American Electric Railway Association, annual convention, and exhibit, Public Auditorium, Cleveland, Ohio. Exhibits open at noon of Oct. 1.**

A bonus system was tried at first in Ottawa, but some of the men put energy saving ahead of service to the public. During the first year there was a saving of 10 per cent in energy with slightly increased car service. As a result of the campaign 10,000 car-hours have been saved by speeding up the lines.

FREIGHT HANDLING BRINGS EXTRA REVENUE

A paper on the benefits of freight handling was presented by T. H. Stoffel, Westinghouse Electric & Manufacturing Company. He pointed out that many opportunities exist for carrying light freight. By developing this business, which can be handled at low cost in addition to the passenger service, extra revenue can be obtained to offset losses in passenger service.

Mr. Robertson cited instances where the Hydro-Electric Railways have obtained extra revenue from freight and package haulage. Steam trains cannot handle this short-haul business economically, so that there is a considerable field for the electric line. On the other hand, trucks cannot move freight economically over 50 to 60 miles even at 100 per cent load.

W. H. Dinsmore, Vancouver, is using buses to pick up small parcels. He has also instituted a service with motorcycles. The business has now been developed to the point where it is the best paying department of the British Columbia Electric Railway.

DEVELOPING NEW SOURCES OF REVENUE

Much of Thursday's session was given over to the discussion of methods of increasing the miscellaneous revenues of a property, following a paper on this subject by W. H. Boyce, Pittsburgh, Pa. Mr. Boyce's paper is abstracted elsewhere. Mr. Robertson said in this connection that reductions in fare for certain specific conditions frequently bring in more revenue.

Mr. Dahl pointed out that the miscellaneous revenue is not a large proportion of the total. He feels that the high point in the Pittsburgh situation is the establishment of a commercial department. This is common practice with other utilities but rare with railways.

C. H. Clancy, Toronto, stated that a commercial department has been established by the Toronto Transportation Commission that is similar to the one described by Mr. Boyce. K. D. Miller, Toronto, feels that much can be accomplished in public relations by assuming that the passenger is always right.

Depreciation of motor buses was considered in a paper by D. E. Blair, Montreal, to appear in a future issue. W. A. Ernst, Grand River, also is of the opinion that a mileage basis for bus depreciation is to be preferred.

Mr. Dahl thinks operators have been too optimistic regarding bus depreciation. Eight years, he feels, is too great for present equipment. Five years, or a 200,000-mile basis, is to be preferred, and 300,000 miles probably represents a maximum performance. He also favors mileage as a basis of depreciation.

Zone fare systems for one-man cars were discussed in a paper by H. E. Weyman, Levis. Several speakers agreed that no perfect system has yet been devised for fare collection and that supervision is most essential.

John McNee, Vancouver, believes that there should be more co-ordination of the manufacturers in order to have an organization furnish cars complete. He feels that more attention should be given to regenerative braking, citing instances in England where it has been used advantageously. He is in favor of retiring obsolete equipment and believes that an investigation should be made of methods by which this may be done.

OFFICERS FOR THE ENSUING YEAR

Mayor Burpee, chairman of the nominating committee, presented the selections for next year's officers. The report was accepted and the officers elected unanimously, as follows:

Honorary president, A. W. McLimont, president and general manager Winnipeg Electric Company.

Honorary vice-president, Julian C. Smith, president Montreal Tramways.

Honorary advisory council: T. Ahearn, president Ottawa Electric Railway; Acton Burrows, president Acton Burrows, Ltd., and proprietor *Canadian Railway and Marine World;* Lt.-Col. J. E. Hutcheson, vice-president and general manager Montreal Tramways; George Kidd, president British Columbia Electric Railway; W. E. Phin, president Dominion Power & Transmission Company; A. E. Warren, vice-president Canadian National Electric Railways.

President, H. E. Weyman, manager Levis Tramways.

Vice-president, D. W. Harvey, general manager Toronto Transportation Commission.

Treasurer, H. C. Patten, comptroller Toronto Transportation Commission.

Auditor, J. E. Richards, manager and treasurer London & Port Stanley Railway.

Executive Committee: The president, the vice-president, the treasurer, the immediate past-president (W. R. Robertson, general superintendent Hydro-Electric Railways), and F. D. Burpee, vice-president and manager Ottawa Electric Railway; A. H. Foster, manager Brantford Municipal Railway; G. E. Waller, manager of railways Dominion Power & Transmission Company, Ltd.; L. Tait, manager and secretary-treasurer London Street Railway; D. E. Blair, general superintendent Montreal Tramways; W. S. Hart, vice-president Three Rivers Traction Company, and treasurer Quebec Light, Heat & Power Company; M. W. Kirkwood, general manager Grand River Railway; C. H. Dahl, assistant general manager Winnipeg Electric Company; D. W. Houston, superintendent Regina Municipal Railway; T. W. Brackenreid, manager Public Utilities Commission, city of Port Arthur.

Luncheon meetings were held on Tuesday and Wednesday at which important topics were considered. At the Tuesday luncheon addresses of welcome were given by Mayor Webb of Winnipeg and Mayor Swain of St. Boniface.

Labert St. Clair, advertising director of the American Electric Railway Association, was then introduced. He spoke on the need for co-operation and understanding between public officials and railway companies. Lack of it, he said, has caused a great deal of trouble.

At the Wednesday luncheon the speaker was C. W. Stocks, editor of *Bus Transportation.* He pointed out the need for a change in thinking by electric railway men, since the transportation business has become highly competitive. He outlined many ways in which electric railways can use buses to advantage without retiring the railway investment. An abstract of Mr. Stocks' talk will appear in a future issue.

Choice of Alloy Trolley Wires

By J. F. Neild

Electrical Engineer Toronto Transportation Commission

We are invited to discuss the relative merits of phosphor-bronze, hard-drawn copper and cadmium trolley wires. At first thought it would seem that their relative merits are competitive. I am not so sure, however, that they are altogether competitive. Rather they represent the efforts of the manufacturers to solve the various problems confronting the railway operators.

Hard-drawn copper may be thought of as the base line, from which to make all comparisons of trolley wire, first, because the widest experience has been had with it; second, because it has been definitely standardized, and third, because it has the lowest cost per pound. Our wide experience has proved there are conditions to be met where hard-drawn copper will not fill the bill, and with these I will deal later. The standard has been established for tensile strength from 47,000 lb. per square inch for 300,000 circ.mil wire to 54,500 lb. per square inch for No. 1/0 wire, all having a conductivity of approximately 97 per cent.

PHYSICAL PROPERTIES OF BRONZES

Bronze trolley wire may be of phosphor bronze, silicon bronze or cadmium bronze. For the moment consider the first two, which are really tin bronzes, a mixture of from ½ per cent to 1½ per cent of tin mixed with copper and deoxidized with phosphorus or silicon. The phosphorus or silicon is introduced as a part of the process of making the bronze rather than a part of the mixture. A little phosphorus or a little silicon may remain, but it still would be phosphor bronze or silicon bronze if none of the agent remained in the mixture.

For electrical purposes a little phosphorus remaining would reduce the conductivity more than a little silicon would. The strength and general properties depend almost entirely on the proportion of tin and the treatment given the material; in other words, the amount of drawing after the last anneal or after the hot-rolling process. These bronze wires are being standardized. Their properties are given in the accompanying table.

Cadmium bronze is a mixture of cadmium and copper or cadmium, tin and copper deoxidized with phosphorus, silicon or similar agent. The use of cadmium in place of all or part of the tin reduces the conductivity less than all tin does, yet it gives strength, hardness and other comparable qualities. Cadmium in an alloy with copper is more difficult to control than tin. It is not practicable to go quite so far with cadmium as with tin in obtaining high strength. These controls, however, are all in practical operation and the increased conductivity combined with strength widens its field of use.

SELECTION OF WIRE DEPENDS ON THE SERVICE

In selecting these various trolley wires for most efficient use, the question of what kind of wear they will be subject to and the service required must be known. Relatively few people seem to realize that any contact wire is subject to two distinct kinds of wear: First, mechanical, and, second, what might be called electrical wear. Mechanical wear is the frictional wear caused by the passage of the collecting device along the wire, while the electrical wear is the effect of the sparking and arcing between collector and wire. For withstanding the mechanical wear undoubtedly the harder alloys stand up the best, and so on down the list until hard-drawn copper is reached, but for electrical wear the reverse is true, as hard-drawn copper will stand up under sparking and arcing as well as any of the alloys, and a great deal better than some of the hard ones.

PROPERTIES OF COPPER AND BRONZE TROLLEY WIRES

Material	Tensile Strength, Lb. per Square Inch	Conductivity Per Cent
Hard-drawn copper	47,000-54,500	97
High-strength wire, silicon bronze or phosphor bronze	66,000-76,000	40
Medium strength wire, silicon bronze or phosphor bronze	59,000-68,000	65
Cadmium-copper	54,000-58,000	92
Cadmium-tin-copper	60,000-69,000	65-80

This shows the importance of knowing all the facts when making a comparison of the wear on trolley wires, as in some circumstances the hard alloy wire will show up extremely well, while under other conditions the same wire will perhaps fail to make a satisfactory showing. It is also necessary to have the wires at the same tension, as the wear undoubtedly increases with the sag between suspension points.

Looking at the question from service conditions, it would appear to me that the following would be the guiding lines in choosing the kind of trolley wire, though not by any means hard and fast rules, as the final choice is a matter of engineering judgment of the service required balanced against cost. For light to moderate traffic on long tangent lines, where the trolley wires are utilized as part of the feeder system, hard-drawn copper or cadmium bronze would appear to be first choice. For heavier service, with some grades or easy curves and with reinforcing feeders, the 92 per cent and 80 per cent conductivity cadmium bronzes and the 65 per cent conductivity tin bronzes would share the field. For intensive service, sharp curves, etc., backed up by heavy feeders, the 40 per cent conductivity tin bronze would compete and probably hold its own over the other types.

---

*Abstract of discussion before the Canadian Electric Railway Association, Winnipeg, May 31-June 2, 1927.

Another point to consider is that the harder alloys will not stand up under excessive short-circuit currents as will the softer alloys. They do not anneal and draw out, but actually break up into beads. The high tin and the high cadmium-tin wires will do this, while hard-drawn copper is not subject to the action.

It would appear, then, that it is not so much a question of the relative merits of the various kinds of trolley wire, but the proper utilization of them. Let me remind you that obtaining the proper wire for the job is only half the battle, as it must be properly installed and maintained. Any wire will crystallize under repeated hammer blows caused by the trolley wheel at hard spots in the suspension or at bumps caused by wrongly designed or wrongly installed ears or fittings. Wires out of alignment are also subjected to excessive wear and tear by the side pressure of the wheel flanges. Worn trolley wheels also cause a great deal of damage to the trolley wire and no end of trouble from a maintenance standpoint.

One-Man Fare Collection on Suburban & Interurban Railways*

By H. E. Weyman
Manager Levis Tramways

It is advisable if not necessary that fares and fare collection on one-man cars and bus be simple and easy in order to lighten the duties of the operator and speed up schedules. Anything that tends to delay the speed and operation of a car is a sore spot with the traveling public, who have been trained by the automobile to expect quickness and dispatch. A minute to wait on a siding where suburban cars meet and pass seems an hour to the passenger. A lady who delays others from entering the car through having to hunt a large leather contraption full of miscellaneous articles causes a distinct change in the atmosphere of the car. Fare collection must therefore be such as to eliminate any delays or obstruction to car movements if the company is to retain its share of the transportation of the public and hold its own with the present-day competition of the private automobile.

The fact that there is no conductor necessitates a departure from old practices. The rate of fare has also an important bearing on the collection. The cash fare should be a simple coin per zone with possibly ticket rates to the constant rider. The copper rate of fare is unpopular and disliked by the public and a complication for the company. The nickel or dime is therefore the logical coin and the zones should correspond to the use of these coins—5-cent, 10-cent, 15-cent zones.

The methods of collection are diversified. Railways of practically the same characteristics often use totally different methods without regard to efficiency, public requirements and operating speeds because of belief or prejudices of the managements. I am, therefore, selecting a few methods which will appeal to the open-minded management. These are: The ordinary fare box system, the hat check system, the duplex ticket system, the differential register system and the ticket issuing machine system.

I think it is only right to mention that no fare collection system has yet been devised which cannot be beaten by the dishonest passenger or employee.

The Standard Fare Box System—As long as the railway zones do not exceed more than two the standard fare box with a register, if required, can be used, making the zones pay enter and pay leave. With a cash fare only, using a single coin fare unit, this is the quickest and simplest method of collection. Owing to certain local conditions some two-zone companies are not able to use the pay-enter and pay-leave. For instance, in order to flag two steam road crossings about a mile or more apart, and also to do police work at this point, on one system the flagman is the ticket collector and policeman for the second zone, traveling on the car until it meets the incoming car, which he boards and returns, making the collection while traveling.

A popular method for more than two zones with the standard fare box is to have the passenger pay on entering, receiving a check whose color and number shows the exact zone to which it is valid. The checks are returned to the operator when the passenger leaves. These checks are quickly identified because all the exit passengers in a given zone should have exactly the same colored checks. The limitations to this plan are that such a transaction with every rider must take up quite a lot of standing time and that there is no record of the distribution and classification of passengers.

The Hat Check System, so common with the steam roads, has been extensively used by electric roads. It requires two men per car and has so many loopholes that it has been more or less discarded and it is being replaced by the duplex system on the steam roads.

The Duplex System includes some type of open pad with a punch or cutter to make the same mark on the passenger's and auditor's portions and the form where the auditor's portion as notched remains in a locked box. On some roads the passenger's receipt, serving as a hat check or kept in sight by means of a clip, is taken up by the conductor; on others this is not done. Observation of the duplex system leads to the belief that it is not well suited for heavy traffic, particularly on one-man cars. The financial leak from the use of duplexes is the possibility of the conductor reissuing a used receipt. This does not require much finesse in the way of sleight-of-hand.

The Differential Fare Register System is another long outstanding system on which the operator makes a blind record of each fare collected according to classification. The passenger has a minimum of interest in the transaction, as he just wants to be sure that he will get the ride he paid for. The protection which the register gives the company depends upon the mathematical skill and memory of the operator. A clumsy thief will soon be caught by the discrepancies between register readings and turn in, while a skillful crook can do very well indeed.

The differential fare register not only shows the classification of fare paid but also shows between what stations or points the ride was taken. As the sheet also shows the on and off times of the operator, it becomes possible to work up a valuable record of the distribution of traffic between different points and during different hours.

One user of this style (Penn-Ohio Lines) gives out individual exit-zone receipts which are returned to the operator. The manufacturer has also brought out a ticket-printing attachment which gives a duplex to the passenger.

The Ticket-Issuing Machine has been recently developed, but is not yet used to any great extent. It has, I think, great possibilities and is well worth study and consideration. Such a machine will issue a printed receipt indicating the names or zones and the fare and date, etc. The operation is pay-enter and passenger pays the operator or puts the fare into the box and gets a ticket or receipt which he must hold and give up when leaving the car.

Under this plan, as outlined, well-nigh perfect check of revenue and riding is possible. The receipts turned in by the operator should balance the returns shown by his counting-type or locked box. From time to time also an analysis can be made of receipts on a given route, hour by hour, to observe the relative distribution of traffic throughout the day. On the whole, this machine ought to answer the purpose of zone-fare lines and opens a field of possibilities.

The Honor System of the Beaver Valley—The Beaver Valley Traction Company, operating near Pittsburgh, deserves special mention for having thrown the entire fare check system overboard with no apparent results to the bad. This property is divided into

---

*Abstract of discussion before the Canadian Electric Railway Association, Winnipeg, May 31-June 2, 1927.

5-cent zones and is operated exclusively with one-man cars. The main line has eight zones. A traffic survey showed that 65 per cent of the passengers rode but one zone and 25 per cent for two zones. This short-haul condition was of importance in deciding to give the no-check or honor system a trial. The plan was strongly advocated by the men as a means of speeding up the service and lightening their labors. It is worth mention that these men averaged a long term of service and had the confidence of the management. The change was made on March 30, 1924. Comparison of revenue before and after indicated to the satisfaction of the management that the honor system caused no loss. Such loss as did occur was definitely identified with industrial depression, for routes which had been operating without need of fare checks (one-zone and two-zone lines) showed still heavier losses.

Regardless of the type of fare collection used, one possible improvement can be applied generally, viz., the use of rate plans which will induce regular and semi-regular users of the service to pay for their transportation in advance. On the longer systems, mileage books sold at some discount have long been popular. Shorter lines with patrons taking twelve or more rides a week might well consider the use of the weekly pass provided the ride is not too long to bear repetition for social purposes. Also there are very few roads indeed that could not simplify their fare collection by selling round-trip tickets at a discount when bought in blocks. All these prepaid transportation plans will help toward getting more of the passengers' fares and getting them faster. The one-man car means a thorough overhauling of old ideas, since the fare collection problem is more pronounced.

Economics in Power Distribution*

By A. J. Westman
Electrical Engineer Montreal Tramways.

ECONOMIC layout of substations and a distribution system for city street car lines is generally a problem requiring the exercise of sound engineering judgment, past experience and a comparison of the various practicable arrangements from all points of view.

In the case of long, single roads, such as interurban or trunk lines, the design is more susceptible to mathematical treatment because the physical layout of the road and the traffic movement are relatively simple. Such is not the case for city street railway systems, where the whole question is complicated by the intricate layout of the tracks, by stringent traffic necessities, by the limitations in the voltage drop in the feeders and trolley wire and by the importance of lowering, to a reasonable value, the potential drop in the track so as to reduce to a minimum the possibilities of corrosion and subsequent damage to underground pipes, cables and metallic structures.

No hard and fast rules can be set for solving street railway networks, but, in our opinion, the "cut and try" method, using the car spot map, described in detail in the reports of the committee on automatic substations of the A.E.R.E.A. for the years 1922-1923, is the best. This method of study is certainly laborious, but we believe it to be more accurate than analytical methods. Such a method was used by the Montreal Tramways some years ago in determining the most appropriate location of the Cote Street substation, rendered indispensable by the great increase of traffic in the congested business zone of the down-town district.

A car spot map was prepared which showed the average distribution and position of cars during the evening rush period; the average current taken by each car was indicated on this map and considered as a load in ordinary statics, so that by finding the center of gravity of all these current loads the most suitable location for the substation was ascertained. The Montreal Tramways has found the results obtained by this means so satisfactory that it is now the standard way in which any new feeder layout or substation is determined.

Pressure Drop Determines Location

As the number of cars is steadily increased on any system and cars run at closer intervals traffic stops become more frequent, thus necessitating a quicker acceleration in order to maintain the schedule speed. This means that the rate of energy consumption per car is greatly increased and, therefore, also the intensity of the electrical loading. It is obvious that the governing factor in feeder design will not be overheating, but pressure drop, and a point will be reached where it will be more economical and generally more satisfactory to increase the number of substations rather than increasing the capital investment in the layout of new feeders.

Increasing the number of substations will affect the governing economic factors as follows:

(a) The cost of buildings and real estate will increase more or less directly with number of substations.

(b) Substation equipment costs will increase, though not proportionately, with the increased number of stations; this increase will be quite appreciable in case of automatic equipment.

(c) Cost of attendance will go up with manually operated stations, and, on the contrary, will be considerably diminished when automatic equipment is used.

(d) Losses in substation machinery will increase slightly if the new stations are manually operated, but will decrease where they are automatic, due to higher load factor of the station and reduction of no-load losses.

(e) Cost of distribution copper and distribution losses will decrease as the number of stations is increased.

For comparison, these quantities must be reduced to a common basis by assuming a so-called "fixed charge" percentage and applying it to first costs. Now, if a curve be plotted representing the sum of annual fixed charges, annual cost of power losses and annual cost of maintenance, as a function of "number of substations," we will have the "total annual cost" graph. This curve will show a minimum because of some of the factors increasing, while others diminish, as the number of stations is altered; the minimum point will indicate the proper number of substations to install from an economic point of view.

This will of necessity require at least a tentative station location design, of equipment and feeder loss calculations for each group of stations considered, and the study can be made even more carefully by changing the size and number of units per station, for a given number of stations. Therefore, several plans will have to be worked out and it is evident that this will entail, particularly if the area is large, a great task both of a statistical as well as of a technical nature.

The design of the negative feeders and the exact calculation of the voltage drop in the track is considerably more complicated than that for the trolley wire and its feeders, on account of leakage current due to the rails not being insulated relatively to the ground.

The Montreal Tramways has developed an extensive and highly satisfactory system of insulated negative feeders in the heavy and medium traffic down-town districts; it is intended to extend it to all other districts, so that ultimately it will have a complete and efficient negative network within the urban area of Montreal and immediately adjacent districts. The general consensus of opinion is that increasing the number of substations is one of the best methods to reduce electrolytic corrosion of underground pipes and structures.

For the last few years the Montreal Tramways has been engaged in thoroughly redesigning its generation and distribution system. The first step taken was to determine the best location for substations. This was done by making up a spot map showing the location of cars during peak load. Arrangements were made to furnish every car conductor with a printed card on which he reported the number of his car and its exact location at 6:10 p.m. on the day selected and the direction in which car was moving; simultaneously a careful record was made of the load on individual trolley sections. With this information available, the cars were located on a map of the city, from which we determined the electrical centers of gravity of selected areas and of areas adjacent to available sources of supply; at the same time a definite policy of changes and extensions was formulated, as follows: (1) Distribute power to substations at 13,200 volts. (2) Interconnect all substations. (3) Reduce the size of trolley sections. (4) Limit total installed converter capacity in any substation to 8,000 kw. (5) Limit the maximum capacity of any converting unit in substations to 2,000 kw. (6) Reduce the number of manually operated converting stations and substitute automatic control. (7) Limit return current to any substation to 10,000 amp., except in emergency. (8) Redesign positive and negative feeder layout. (9) Systematically check rail bonding conditions. (10) Ring-bus all intersection work in track. (11) Install a telephone system between stations and supervise operation by means of a load dispatcher.

---

*Abstract of a paper before the Canadian Electric Railway Association, Winnipeg, May 31-June 2, 1927.

Obviously to carry out this policy some considerable time and expense were involved and the tramways has not yet completed all the work entailed, particularly in regard to reducing the number of manually operated substations, but much of it has been carried out.

A high-tension conduit system was constructed between the Hochelaga power house and the main substations. This conduit was liberally designed to permit of future developments, 4-in. round bore clay tile ducts being used. The copper cables installed in these ducts are all three-conductor, sector shape, No. 0000 A.W.G., paper insulated for a working pressure of 17,000 volts, the insulation thickness being ½ in. between conductors and ½ in. between conductors and lead sheath, the sheath being 9/64 in.

While this conduit work has been completed, further extensions of the system are in contemplation, the intent being to have ultimately a high-tension ring bus so as to make the delivery of power to converting stations as reliable as is reasonably and economically feasible.

Arrangements have been completed with the local power company for the delivery at two points of bulk power, in the form of three-phase, 60-cycle current at a pressure of 12,600 volts. In the east end of the city, at Hochelaga, which is one of these delivery points, the company has a thoroughly modern steam plant consisting of two 15,630-kva., 13,200-volt, three-phase, 60-cycle steam turbines and 4,000 kw. of engine-driven d.c. units, which are all available as a steam reserve in the event of any failure in the supply of purchased power.

IMPROVING THE RETURN CIRCUIT

Since 1918 all rail joints in paved streets have been electrically welded, while on suburban lines rail joints have been bonded by means of head or concealed copper bonds, either braised or welded to track. In Montreal all track intersection work has been completely ring-bussed with copper cable, the size of this cable being equivalent to rail capacity at important locations. The copper bus cables surrounding any special work are laid in small wooden troughs filled with pitch and carefully tied in with the intersection by means of auxiliary cables of 500,000 circ.mil with No. 0000 tail bonds. These ring buses are laid well clear of the intersections and bonded to tracks about 5 or 6 ft. from special work, in order to eliminate joint vibration and also to permit of special work being raised without interference to cables.

The Montreal Tramways has abandoned its former practice of laying an auxiliary copper cable between its tracks as a continuous bond, and the current flow in rails is now equalized by means of 500,000-circ.mil copper cross bonds, with No. 0000 tail bonds at each end, installed at intervals of about 500 ft.

The tramways distribution system in Montreal is divided into 22 trolley sections, with an average maximum of 39 cars in each section. Our present policy is to increase the number of trolley sections in order to decrease the number of cars per section. It is our practice to connect each trolley section to at least two stations.

As the number of our substations increases, and as we complete the duplication of high-tension power supply, the tendency will be to serve each trolley section from one station only, seeing that it is obviously more economical to duplicate power supply at high voltage between stations than to duplicate, or even triplicate, the supply from several stations to any particular trolley section at 600 volts.

The size of trolley wire used is No. 00 in city distribution and No. 0000 in suburban work, while the standard type of rail used is 115-lb. girder in city streets and 85-lb. "T" in open suburban work. In the underground or central district all positive and negative feeders are 1,500,000 circ.mil, the negative feeders having a potential wire in the same sheath, which is used for checking distribution of return current.

Rail taps from underground service to track are made with 1,000,000-circ.mil cable and feed in taps to trolley with 500,000-circ.mil cable, both rail and trolley service taps being furnished with suitably inclosed disconnecting switches in manholes. In aerial distribution work the standard sized feeder is 500,000 circ.mil with 250,000-circ.mil feed in taps to trolley.

Lightning arresters are used in all trolley feed in taps from underground service, as well as at points where aerial feeders connect. No arresters are used in general city service other than as above, but all suburban lines are fully protected.

The results we have obtained with synchronous converters have been most satisfactory as regards general operation, maintenance and efficiency, the efficiency of the 2,000-kw. units being over 94 per cent on full load.

A still more recent development, and one which has received our closest atattention, has been the introduction of the mercury-arc rectifier. The Montreal Tramways has recently constructed a substation at Verdun, using this type of equipment entirely. A full description of the installation is contained in ELECTRIC RAILWAY JOURNAL of April 30, 1927. The operating results obtained at Verdun to date have been highly gratifying, although the station has only been in operation about four months; however, we feel so certain that the mercury-arc rectifier has come to stay and has so many characteristics that are superior to other types of converting equipment that we now have plans in hand for the immediate erection of a second substation which will be equipped in a manner similar to the one at Verdun.

The automatic station has now been developed to a point where it can be considered as thoroughly reliable and in many respects superior to the manually operated station. It has, of course, some limitations which may be overcome to a large extent by partial or full "supervisory" control, but a careful perusal of the technical press will show that the use of automatic substations is growing in favor.

Development of Miscellaneous Revenue*

BY W. H. BOYCE
Commercial Manager Pittsburgh Railways, Pittsburgh, Pa.

DURING the receivership of the Pittsburgh Railway, from 1918 to 1924, rates of fare were gradually increased from 5 cents until a ruling of three rides for 25 cents was reached, and under this rate it became apparent that the system could be operated to carry the financial burden necessary under company control and management. At the termination of the receivership, Col. Thomas Fitzgerald was made general manager and later vice-president of the company. At this same time the president announced, among other things, the creation of a commercial department. The creation of this department embodied the management's belief that the sale of rides should be clearly separated from the manufacture of car-miles. So far as is known, it is the only commercial department on American electric railways organized with such broad powers. Its work, under the direction of a commercial manager, falls under the four main subdivisions of traffic, public relations, publicity and safety.

Traffic promotion is under a director, to whom the supervisor of investigations and his three investigators and the supervisor of checking and his ten checkers report.

The character and amount of publicity are specified by the commercial manager.

The director of public relations is a liaison officer in relation with the police and fire departments, county detectives and other municipal representatives. He is also the clearing-house for all complaints, commendations and suggestions from the patrons of the company. Whether these come in person, by mail or by telephone, no complaint is left unsettled. In the case of complaints by mail, personal visit at the home or office of the complainant is the regular practice. In other instances, where a laborer has been hunted up at his work, the employer himself has secured a new light on the earnestness of the management.

The chief aim of all of us, however, was to win back the popularity of the street cars and to bring back the patrons to their seats in the trolleys, and to this end we devoted our efforts.

---

*Abstract of a paper before the Canadian Electric Railway Association, Winnipeg, May 31-June 2, 1927.

While the population of Pittsburgh proper is only about 650,000, the railway serves more than a million people. In 1926, 396,000,000 passengers were carried. In the same period, more than 40,000,000 car-miles were operated, with total revenue slightly in excess of $21,000,000.

Of this, $440,000 or about 2 per cent was miscellaneous revenue. A little more than half of it was received from four principal sources, namely, freight service, express service, power sales, and rental of tracks, equipment, and real estate. These sources are more or less familiar to all of you.

The largest single source of miscellaneous revenue is that of inside and outside advertising on the trolleys, the sum of this source totaling $148,350, which is more than one-third of the whole amount of $440,000 for the past year. Station privileges have been let to individuals for the selling of lunches, books, magazines, tobacco, etc., and to companies which have installed scales, automatic candy and chewing gum machines.

Of all the objects set before an electric railway management, that of securing more revenue from more, instead of less, riders should rank first and that of miscellaneous revenue should follow. It goes without saying that adequate revenue is necessary to the very life of a railway, but every means should be tried to secure such adequate revenue without impairing the railway's usefulness to the community. A change in fare which produces more revenue from more riders must enhance the good will of all who benefit from a growth in voluntary travel. This good will is often of such tangible value in leading to tax relief, new franchises and other advantages that one can really consider fare changes not from the standpoint of more gross but from the standpoint of more net. There are times when it is wise to drop a possible $10,000 in gross receipts when the reward is relief from an assured $30,000 paving or other assessment.

Fare Changes Which Have Popularized Service

From the first, the Metropolitan Pittsburgh District was far too large to be a one-fare area. When the property was relinquished by the receivers, the fare structure, exclusive of the interurbans, and Washington City, was as follows: 10 cents cash or 8⅓ cents tokens (three for 25 cents) good for one zone from Pittsburgh center, a distance varying from 5 to 7 miles; 10 cents for fare including a crosstown transfer good for 1½ to 2½ miles each side of Pittsburgh center; 10 cents flat on owl cars; 10 cents cash or 8⅓ cents token for additional zones with some routes having four zones.

Analyses of traffic obtained during the course of different increases in fare revealed a loss in usefulness. This was especially apparent from the fact that, despite restrictions in their use, free transfers rose in number at the very time that cash fares dropped. It was obvious that the public was doing all it could to avoid extra fares—whether by changing jobs or residences or taking longer walks.

In trying to correct these conditions, the new management necessarily had to feel its way. The first changes were of comparatively trivial effect on revenue and riding, but they were a welcome indication to the patrons of the management's desire to do something at once. It will be seen that as time went on, the changes grew in importance until with the installation of the Pittsburgh weekly pass on June 1, 1925, the company offered to all regular riders within one zone of downtown Pittsburgh center a fare rate equal to or less than that of 5 cent days.

In the following chronology of changes in fares and fare collections, the transfer liberalizations covering more than 125 orders for more than 1,000 concessions have been omitted to avoid laborious detail. Some of these cut off a full fare, while others gave patrons the opportunity to reach their destinations via a greater choice of routes.

Fare changes which have resulted in an increase in gross include extensions of zone limits; establishment of reduced-rate short-haul fares, reduced-rate through or round-trip tickets; liberalization of transfer privileges; combination transportation-amusement tickets; extension of a car line at the same fare; increase in the age limit for children's free rides.

If a passenger inadvertently drops excess fare into the farebox, the conductor (or operator) is authorized to make a refund up to 50 cents on his own responsibility, and if a patron wishes to pay three standard fares at a time, 25 cents may be dropped into the box directly without the purchase of tokens.

Sunday and holiday passes, sold for 25 cents within one zone and 40 cents for the entire Pittsburgh district, were inaugurated. The success with these was so great that weekly passes were established in Washington and McKeesport. These also were successful. June 1, 1925, saw the start of the first unlimited-ride weekly pass used on any American surface railway serving more than 150,000 inhabitants. The cost of the pass is $1.50 or eighteen token fares, and it is good for unlimited riding by the bearer within the one-fare area from the center of Pittsburgh. Experience with the Sunday-Holiday pass in Pittsburgh and with the weekly pass in smaller cities indicates that the passholder averages a fare of 5 cents or less.

In some instances special shoppers' cars have been run by merchants, with a half fare to patrons. The railway has been given a guarantee in each case by the merchants, keeping all collections if over the guarantee. Chartered cars also are operated to a considerable extent.

Another enterprise affiliated with the Pittsburgh Railways is the Equitable Sales Company, which has several gas and electric shops in the Pittsburgh district. Through arrangements made with the sales company, the railways organization has increased the advance sale of its weekly passes, by issuing coupons on sale of passes on Friday, Saturday and Sunday previous to the week in which the pass is good, and by permitting pass holders to present their four or five coupons used each month as redeemable for $2 or $2.50 on the purchase of certain electric or gas appliances at these stores. Each coupon represents a value of 50 cents and may be turned in on the article offered for that month.

Another source of revenue is that derived from the operation of motor coaches. The Pittsburgh Motor Coach Company, the entire stock of which is owned by the Pittsburgh Railways, was formed after an agreement had been reached as to the price to be paid to the only operator of motor coaches competing with the railways. In general the length of ride of these routes is slightly more than 5 miles with a flat fare of 25 cents and these coaches, 36 in number, are being operated at a profit.

These for the most part are the methods in use on our property for developing miscellaneous revenue, but we do not feel that this type of revenue has been developed on our lines to the extent that it might have been if greater efforts had been made. There are many other plans in effect in other cities in the United States that are perhaps just as effective as those in use in Pittsburgh. These include the sale of space on the backs of transfers, installation of vending machines in the cars, rental of entire cars during the off-peak periods for advertising, sale of tickets with coupons redeemable for merchandise, sale of rides to merchants by newspaper coupons for free transportation of customers, and rental of the entire street car system to department stores or other merchant groups.

American Association News

Membership to American Electric Railway Association Increased

THE American executive committee at its June 3 meeting approved for membership the following operating, associate and manufacturer member companies, together with new individual members. These applications were made for membership since the executive committee meeting held April 1, 1927, and reported in ELECTRIC RAILWAY JOURNAL for April 9:

Company Membership

Operating Companies

Compania Chilena de Electricidad, Limitada, Santiago, Chile.
The Mississippi Power & Light Company, Jackson, Miss.

Manufacturer Companies

Walter Bates Steel Corporation, Gary, Ind.
Cinch Manufacturing Corporation, Chicago, Ill.
D. B. Flower, Philadelphia, Pa.
General Carbonic Company, New York, N. Y.
Guide Motor Lamp Manufacturing Company, Cleveland, Ohio.
Hunter Illuminated Car Sign Company, Flushing, N. Y.
India Tire & Rubber Company, Akron, Ohio.
Protext Glass Company, New York, N. Y.
Toledo Pressed Steel Company, Toledo, Ohio.
Edwin L. Wiegand Company, Pittsburgh, Pa.

NEW INDIVIDUAL MEMBERSHIPS

Affiliated with Member Company

Operating

Engineering

Herbert R. Bristow, general foreman Toronto Transportation Commission, Toronto, Ont., Canada.

Thomas F. Burke, engineer of car equipment Interborough Rapid Transit Company, New York, N. Y.

F. W. Drowley, roadmaster Toronto Transportation Commission, Toronto, Ont., Canada.

C. R. Kinnear, assistant engineer Toronto Transportation Commission, Toronto, Ont., Canada.

W. M. Raiguel, engineer of way Philadelphia Rapid Transit Company, Philadelphia, Pa.

Lewis E. Summers, assistant operating manager subway-elevated lines, Philadelphia Rapid Transit Company, Philadelphia, Pa.

Harry G. Werner, assistant electrical engineer Philadelphia Rapid Transit Company, Philadelphia, Pa.

Transportation and Traffic

Frank B. Adair, assistant general superintendent Terre Haute, Indianapolis & Eastern Traction Company, Indianapolis, Ind.

Paul E. Coffey, clerk to superintendent of garage Montreal Tramways Company, Montreal, Que., Canada.

C. D. Hardin, traffic manager Interstate Public Service Company, Indianapolis, Ind.

Manufacturer

American

Walter T. Sheldon, railway representative Pratt & Lambert, Inc., Buffalo, N. Y.

Engineering

Walter A. Giger, electrical engineer traction division, American Brown Boveri Electric Corp., Camden, N. J.

J. F. Tritle, engineer Control Division, railway engineering equipment department, General Electric Company, Erie, Pa.

Not Affiliated with Member Company

Operating

Engineering

Harry F. Ferguson, general foreman Department of Street Railways, Detroit, Mich.

William Machleit, general inspector Department of Street Railways, Detroit, Mich.

T. Sakamoto, Japanese Government Railways, New York, N. Y.

Kagoro Ochiai, electrical engineer Electric Bureau, Japanese Government Railways, Tokio, Japan.

Maurice Toby, assistant supervisor of way and structures, Eighth & Ninth Avenue Railway, New York, N. Y.

Manufacturer

American

Mrs. A. Fenton Walker, United States and British representative *Canadian Railway and Marine World*, New York, N. Y.

American Executive Committee Meets

SUBJECTS of major importance occupied the attention of the American Electric Railway Association executive committee at a busy meeting held at association headquarters in New York on June 3, 1927. Those present included the following: W. H. Sawyer, president; R. P. Stevens, J. H. Hanna, L. S. Storrs, F. R. Coates, C. B. Proctor, Daniel Durie, J. V. Sullivan, Harry Reid, C. E. Morgan, E. P. Waller, B. A. Hegeman, Jr., T. A. Kenny, M. B. Lambert, S. J. Cotsworth, C. R. Ellicott, L. C. Bradley, H. L. Brown, T. W. Casey, E. B. Meissner, Robert I. Todd, C. D. Emmons, A. W. Brady, Gen. G. H. Harries, Edward Dana, H. B. Flowers, H. L. Mitchell, T. R. Langan, J. W. Welsh and Mr. McKay representing G. H. Ernsberger of the Oklahoma Utilities Association.

A report for the publicity committee made by Barron Collier, vice-chairman, was read by Secretary Welsh. The committee reported the preparation of three new posters since the last meeting. The subjects are traffic congestion, shop or carhouse safety and interurban merchandising. Interurban poster service is being broadened by the committee. At least one out of each three posters prepared is now being directed to interurban work. Plans are being made to issue some large one-sheet posters directed to merchandising interurban freight.

The booklet on electric railways for use in schools has been thoroughly revised and is being offered to individual companies. It has been distributed to the extent of 20,000 to the New England district by the New England Committee on Public Utility Information and to the extent of 5,000 in Indiana by the Indiana committee. In other states it has gone forward to the individual member companies.

Under the supervision of the Board of Education in Cincinnati a booklet on the Cincinnati Street Railway has been prepared and distributed among Cincinnati schools. Copies of the book have been distributed to member companies with the suggestion that they might do well to follow a similar plan with the schools in their respective localities.

Reporting for the membership committee, Chairman C. R. Ellicott took occasion to stress the importance of membership to the existence and progress of the association. He characterized a continual flow of new members as constituting the very lifeblood of the association and made a plea for co-operation on the part of each member of the committee and of operating executives interested in the association's progress, even though they are not active members of the committee. Two new operating company members, ten manufacturers, and 21 individual members were reported since the last meeting of the executive committee.

Chairman C. E. Morgan for the finance committee reported that there had been a reduction made in operating expenses for a period of six months amounting to $17,477. This, he said, had been brought about through the full co-operation of the association's operating staff.

Harry Reid, chairman of the committee on national relations, said that there are no problems which require the attention of his committee at the moment. He took occasion to compliment Managing Director Storrs and the members of the sub-committee on depreciation, who succeeded in winning a postponement of the depreciation hearing before the Interstate Commerce Commission in order to give the industry time adequately to prepare its case.

A report of the committee on co-operation with manufacturers was read by Secretary Welsh. Booklets reproducing an address by City Manager Sherrill of Cincinnati have been distributed by the committee through the manufacturers. Two posters for use on bulletin boards and stickers for use on freight and express packages have been offered to manufacturers. The committee has decided to issue two booklets, one dealing with the sale of car rides and the other directed to electric railway salesmen to point out how they may help in stimulating the adoption of better methods of getting business.

The committee is going to make a special effort to induce manufacturers to visit the electric car exhibit at the convention this year. A letter also has been written to the editors of the various trade journals asking them to run editorials just before the convention urging all exhibitors to visit the electric car exhibit and take some customers with them. A letter also will be sent by the chairman of the committee to manufacturer members shortly before the convention urging them to fall in line with this work.

A suggestion by Chairman F. R. Coates was made in behalf of the committee on co-operation with state and sectional associations, for the coming Cleveland meeting. He felt that it would help to foster a spirit of co-operation if there could be a meeting arranged to include his committee, the executive committee and representatives of the various sectional associations. This matter was referred to the committee on meetings and subjects.

Work of the committee on revision of the constitution under the chairmanship of C. D. Emmons was taken up in detail. The revised constitution was adopted by the executive committee for presentation at the convention. At the suggestion of the executive committee a statement will be prepared by Mr. Emmons' committee explaining, for the information of the industry, the principal changes made in the constitution and the reason for this action.

A report was submitted by the special committee authorized at the last executive committee meeting to devise if possible a plan to carry out the recommendations made by the policy committee in regard to changes in the association's publishing policy. The report indicated that the policy committee's recommendations in favor of reducing the publishing cost of *Aera* and bringing about greater co-ordination between the association and the technical press to minimize duplication can be carried out in the interests of the industry. This report was received by the executive committee on motion of R. P. Stevens. The publications committee was instructed to carry out the plan outlined by the special committee and to make this effective at as early a date as is practicable.

The sentiment of the manufacturers regarding various features of the exhibit was expressed in the report of a special committee under the chairmanship of T. W. Casey. Its recommendation favored keeping the exhibit closed to the public. In addition it recommended that the showing of baseball scores as prominently as was done last year be eliminated. Stimulation of attendance at the exhibits when they are opened on Saturday noon was strongly urged. A suggestion was made that week-end trips for employees in the vicinity of Cleveland be arranged.

The date and place of the next meeting was left to the president.

The News of the Industry

New York State Men Reject Renewal Proposal

For the second time within a month employees of the Rochester, Utica and Syracuse lines of the New York State Railways voting simultaneously rejected the proposal for renewal of the 1926 wage agreement. The vote was 883 to 652. The proposal had been rejected previously by 133. It is believed that arbitration will be resorted to, although further bargaining is being carried on in the hope of framing a satisfactory contract.

Rehearing Sought in Des Moines One-Man Car Issue

The Des Moines City Railway, Des Moines, Iowa, has filed application for a rehearing before the Iowa Supreme Court, which on April 7 handed down a decision upholding the validity of an agreement between the company and the street car men's union requiring the presence of a motorman and a conductor on every Des Moines street car. In the application the company sets forth that the twenty-year agreement between the car men and the company, which has been in effect since 1915, is in violation of the public interest; that lack of a decision by the court on the validity of the check-off places the company and the public in continual jeopardy of a strike; that the section of the agreement which prohibits one-man cars is void, and that the entire contract is void because it unionizes an entire industry in the community. The petitioner takes issue with the former decision of the court with regard to the right of the company to question the agreement or contract with the car men. It is claimed by the company that under the provisions of a service-at-cost franchise it has an "indisputable status as a representative of the public interest."

In part, the petition declares:

> The 1921 franchise provides for street car service at cost and for a variable rate of fare which fluctuates with the cost of production of service to be given by the company under the franchise. It is thereby demonstrated that the public in general and the car-riding public in particular is vitally interested in the cost of production of street car service in Des Moines. The higher the cost, the higher the rate of fare, and the cost of a ride is correspondingly greater to each individual rider.
>
> The public now has a very direct financial interest in the street car business and is quite directly interested in the inauguration of improvements that will lower the cost of operations, and hence tend to lower the cost of fare to be charged. And the public is vitally interested in the elimination of anything which tends to impair the ability of the company to perform its duties and obligations under the present franchise.

Meanwhile the company continues to show increasing monthly operating deficits under two-man operation. The report of the auditor for April showed that the deficit for the month was $10,875 and that the total accumulated deficit to the stabilizing fund was $47,417 as of April 30. The company is still operating under a 10-cent cash fare and a weekly pass which sells at $1.25. The pass is transferable and good for any number of rides during the seven-day period. The total weekly sale runs from 10,000 to 12,000.

Public Hearings on Chicago Enabling Bills

Mayor Thompson Gives Full Approval to Bills as Amended by Aldermanic Body—Senate Passes Two of Five New Railway Measures

Responding to pressure brought to bear by a number of questioning Senators and by various civic organizations in Chicago which have insisted that the bills are being rushed through to a vote without an adequate opportunity for study and discussion, the joint committee on public utilities of the Illinois State Legislature called a final public hearing on June 7 for the five enabling bills introduced last month by the Chicago transportation companies. The bills had been reported out and recommended for passage by this committee on May 31, after two days of public discussion, and are already on the second reading in the Senate. It was for the purpose of giving every one an opportunity to suggest any amendments which in his opinion might improve the bills and of correcting what it was feared might arouse unfavorable public and newspaper opinion that the hearings were reopened. Another reason for delaying action on the bills was said to be the hesitancy on the part of several senators to pass on the bills without first obtaining the views of Mayor Thompson.

Amendments to Bills Dropped

The Senate passed and sent to the House on June 9 two of five Chicago traction bills. Others were scheduled to pass on June 10 unless sentiment changes radically. The subway bill won by 30 votes to 20. The second bill rescinding the twenty-year franchise limitation was approved by 34 to 8. The majority of the amendments proposed to both of these bills were dropped.

Objections to certain features of the bills were loudest from the quarter of the local transportation committee of the City Council, where bill No. 5, which would amend the state utilities act and provide for control of the consolidated system by a mixed commission of city, county and state appointees with jurisdiction over lines in every part of Cook County, was closely scrutinized for possible omissions and clauses liable to be misinterpreted. Notwithstanding Mayor Thompson's approval of the basic principles involved and his conviction that this bill gives the largest possible measure of home rule consistent with the laws of the state and the early solution of the problem as a whole, the Aldermen found much to be desired in the bill in its present form. They are opposed to the clause which makes the proposed county transit commission subject to supervision by the Governor and financially supported by the state, declaring that such terms remove the last vestige of local control of the city's transit system from the City Council. The local transportation committee has been a consistent advocate of the previously reported Durso bill, which proposes to take control of the Chicago local transportation agencies entirely out of the hands of the State Commerce Commission and vest it in a purely local body.

The committee also voiced objections against bill No. 2, which amends the cities and villages act of 1872 by dropping the twenty-year limit on future railway franchises and provides for the issuance of terminable permits. As a result of the hostility shown by several members, Corporation Counsel Samuel Ettelson was instructed by the committee to draft a substitute bill which will leave it discretionary with the City Council to grant term franchises or indeterminate permits.

In an address before the West Towns Chamber of Commerce, John M. Harlan, attorney for F. J. Lisman & Company, whose proposal to take over the surface lines under a twenty-year franchise is still pending before the local transportation committee, maintained that the bills are "full of dangerous jokers and are designed to put the city's transportation lines more firmly in the grip of Samuel Insull." He declared that passage of the bills would mean a perpetual franchise and would prohibit the city from granting a twenty-year franchise. A joker in Section 6 of the subway bill, he said, will mean the expenditure of many millions of dollars by the city in relocating public utility properties which interfere with subway construction. Failure of the drafters of the bills to say anything about a referendum was another point he attacked.

In answer to the statements made by critics of the measure, Mr. Insull said:

> Elimination of the present twenty-year restriction on street railroad grants is certainly not a "joker" as the term is commonly understood. Provision for this elimination is stated as plainly as possible in the

bills themselves and has been emphasized in all statements from proponents of the bills.

The only restrictions upon future action by the City Council in dealing with local transportation are that future street railroad grants shall be indeterminate during "good behavior" so to speak, and that terms and conditions be not inconsistent with existing law. It is expressly provided that street railroad construction or operation shall not be possible without the consent of local city authorities.

If the City Council does not want unification and development of local transportation and rapid transit, if it prefers to let the city stumble along under present conditions, it may do so.

The elevated loop is not involved in the proposed legislation. What may be done with the loop is a detail to be disposed of when the City Council undertakes to frame an ordinance for unification and development.

There is no reason why a referendum should be referred to by name or otherwise in the proposed legislation. The city authorities have full power to prescribe a referendum on any ordinance for unification and development that may be framed. If the City Council and the city administration can be trusted to deal with all the complexities of a grant for unification and development, surely they can be trusted to prevent any "fast and innocent stuff being pulled" by way of an indeterminate permit as an extension of the present temporary permit to the Surface Lines.

Whether these and kindred misrepresentations are made willfully or misunderstandingly, the effect of them is that of the traditional red herring drawn across the path of the proposed legislation. They only clutter up and confuse and impede full and frank discussion of the traction situation.

The principal defender of the measures was Patrick J. Lucey, attorney for the Insull interests. In explaining the provisions of the home rule and indeterminate bills, at which the heaviest opposition was directed, Mr. Lucey asserted that the home rule idea is the "most comprehensive and complete home rule plan that has ever been developed." On the question of terminable permits, he said: "Twenty years is too short a time to finance a big property. It cannot be done. An indeterminate franchise is necessary. This is the sanest and cleanest-cut plan that has ever been presented for a solution of the problem."

"Nellie Kelly" Goes Over Big in Buffalo

Employees of the Philadelphia Rapid Transit Company, Philadelphia, Pa., who presented George M. Cohan's musical comedy "Little Nellie Kelly" in the Academy of Music in Philadelphia earlier in the season, went to Buffalo and staged the show for three nights in the Teck Theater for the benefit of the Helping Hand Fund of the International Railway Co-operative Association of Buffalo. The theater was sold out for each of the three nights of the show. Almost 100 were in the cast, staged under direction of W. A. Costello.

Confer on Wages.—Negotiations are now in progress between the officials of the Connecticut Company, New Haven, Conn., and the executive committee of the trolley men's union, but no decision has been reached. It is said that the men are demanding a wage of 75 cents an hour for the operators of two-men cars and 15 cents an hour additional as the rate to be paid for one-man car operators. Eight hours instead of nine for a day's work is also asked.

Extension of San Francisco Municipal Railway Opposed

The question of municipal ownership as applied to water and transportation will be passed on by voters of San Francisco on June 14, when the fate of proposed bond issues totaling more than $50,000,000 will be decided. A two-thirds vote will be required to pass each of the five issues up for approval. The Chamber of Commerce has voiced its disapproval of the $4,700,000 bond issue for municipal railway extensions, and the passage of this portion of the bond program is very much in doubt.

The San Francisco Real Estate Board is another strong organization that has refused to sanction the idea of municipal railway extension bonds, declaring in a lengthy statement that at least two sections of the city in which it is desired to extend the car lines are already adequately served by the Market Street Railway.

At the present time the total municipal railway trackage in San Francisco is 69.4 miles. The new bonds provide for 29 miles of additional track.

The bonds, if voted, will give the municipal line the use of the new Duboce tunnel into the rapidly growing Sunset district. This tunnel was built by special assessment of the property owners at a cost of $1,250,000.

Another tunnel use of which is desired for the municipal line is the proposed Bernal cut, for which bonds amounting to $1,400,000 are asked of the voters in Tuesday's election. This is a surface tunnel in the Mission district, linking that district with the new Excelsior district now served by the Market Street Railway.

Other extensions for which bonds are asked are: Marina Loop, to cost $94,000; Balboa Street line to the beach; Taraval Street line, along the beach to the Fleishhacker Pool, a favorite playground in the city, and the Eureka Valley extension, which Mayor James Rolph personally sponsored.

Even friends of the bond issue admit that the Eureka Valley extension is unnecessary at the present time and will probably cause a deficit, as the district is now adequately served by the Castro line of the Market Street Railway. It is pointed out, however, that the franchise of the Castro line has not long to run.

It seems likely that the voters will approve $40,000,000 bonds to purchase the distributing system of the Spring Valley Water Company, as only slight opposition has apparently developed to this plan.

Ten Cents Sought in Atlanta

A petition of the Georgia Power Company to charge 10 cents for a cash fare and 25 cents for three tickets in Atlanta, Ga., was filed on June 3 with the Georgia Public Service Commission.

In its petition the company states that at the present time the railway in Atlanta is failing to yield an income of 8 per cent by approximately $1,000,000 a year.

The request is in line with a sliding scale of rates proposed more than a year ago, when a survey was made of the entire railway situation and it was agreed that if the present rates did not provide the necessary funds a reasonable increase in rates would be granted.

Rates at the present time are 7 cents for a cash fare and 20 cents for three car tickets, with fifteen tickets sold for $1. These rates went into effect in 1920, at which time the fare was increased from 6 to 7 cents.

Six Months' Respite to Be Asked in St. Louis Fare Case

City Counselor Muench of St. Louis, Mo., plans to ask the Missouri Public Service Commission for six months' time in which to prepare the city's defense to the application of Receiver Rolla Wells of the United Railways for an 8-cent fare and a valuation in excess of $75,000,000. If the commission grants the city this concession it is probable it will sanction temporary relief for the railway in the form of some increase in fares, possibly two tokens for 15 cents. The present fare is 7 cents.

COMPARISON OF THE EARNINGS OF UNITED RAILWAYS, ST. LOUIS, MO., FOR YEAR ENDED DEC. 31

	1926	1925
Gross operating revenue....	$18,873,431	$18,894,575
Expenses, depreciation and taxes..................	16,445,146	16,494,778
Operating income..........	$2,428,295	$2,399,797
Other income.............	202,874	285,450
Gross income.............	$2,631,168	$2,685,247
Interest and miscellaneous charges..................	2,677,569	2,892,515
Loss from operations.......	$46,400	$207,268
Rental from bus equipment.	2,836	1,094
Net loss for year..........	$43,564	$216,174

The company at the recent hearing on the petition claimed that its reproduction cost new, less depreciation, is $98,573,264 for operating property. Its actual investment cost for the operating property was $59,958,352. Somewhere between this range of $40,000,000 it hopes to have its rate-making valuation set and to be permitted to earn 8 per cent on such valuation.

In the negotiation between the city and the company relative to a 30-year service-at-cost franchise the St. Louis Public Service Company, which will succeed the United Railways under foreclosure, has sought to obtain a 7 per cent return on a valuation of $58,700,000, which the commission set some time ago. A 7 per cent return on $58,700,000 would be $4,109,000, while 8 per cent on $75,000,000 would be $6,000,000. To net the latter amount the company would need a 9-cent fare. At present the company earns only 4.2 per cent.

The net loss of the company for the year 1926 was $43,564, compared with a loss of $206,174 in the preceding year. A summary of the statement of earnings contained in the pamphlet report of Receiver Rolla Wells as filed with the United States District Court is contained in the accompanying table.

Wage Issue in Chicago Becomes Acute

Demands of some 15,000 platform men and other classes of employees of the Chicago Surface Lines, Chicago, Ill., for a wage increase of 15 cents an hour were denied recently by the companies' executives. The latter have countered with a proposal to reduce the men's wages 5 cents an hour below the present scale of 75 cents an hour.

As a result of the management's action members of the local street and electric railway employees' union voted on June 6 to hold a strike referendum. If voted, the strike will not be immediate, but will be called at the instance of President William Quinlan of the union, should he be unable to reach a satisfactory wage agreement with the Surface Lines. The street car employees have been working without a wage contract since negotiations for a 5-cent increase failed a year ago this month.

Following the refusal of the Chicago Rapid Transit Company to consider a demand for a 15-cent increase over the present 72-77-cent hourly wage rate, 5,000 elevated trainmen are also expected to hold a strike referendum.

Negotiations of this company for a new scale to replace the agreement which expires May 31 were opened several weeks ago. At that time Vice-President Bernard J. Fallon informed the union representatives that conditions did not warrant the paying of increased wages and asked the men to accept a cut of 15 cents an hour. A wage increase of only 5 per cent, he contended, would wipe out the company's operative profit.

Medal for Safety in Atlanta

A gold medal, to be known as the Cody Safety Medal, has been offered by Chief William B. Cody of the Atlanta fire department to the Atlanta (Ga.) trainman who completes the year 1927 with the best safety record. It is probable that the medal will be offered each year in the interest of promoting greater safety in the city.

Dedication of Business School of Harvard University

In the presence of a great throng of distinguished visitors, the new buildings of the Harvard Graduate School of Business Administration were dedicated at Boston on June 4 with addresses by Owen D. Young, former Dean Edwin F. Gay, Dean Wallace B. Donham and others.

George F. Baker of New York, donor of the magnificent group of new buildings designed to house the activities of this notable school of economics, finance and commerce, presented the keys to President Lowell of Harvard University and added another $1,000,000 to the $5,000,000 already given by him to the institution.

In his address Mr. Young outlined the evolution of trade from primeval days, discussed the increasing trend toward high ethical practices in modern business, emphasized the rise of the trade association as a factor in creating sentiment, and dwelt upon the growing importance of investment sharing by labor in the enterprises in whose responsibilities it is increasingly concerned. The part such an institution as the Harvard school may play in economic problem research and in training men for business as a profession was comprehensively outlined. Mr. Young said that he regarded the question of unemployment as one of the most important to which consideration should be given.

East St. Louis Cuts Fare in Lean Hours

To encourage travel during the hours of the day and evening when patronage has been lacking of late, the East St. Louis & Suburban Railway, the East St. Louis Railway and the Alton, Granite & St. Louis Traction Company, all operating in and out of East St. Louis, Ill., will offer bargain rates during certain periods of the day in June, July and August. Non-rush-hour tickets will be sold at the rate of seven for 50 cents, compared with the regular rate of 10 cents or five tokens for 40 cents. The bargain tickets are good all day Sunday and on weekdays from 9 a. m. to 3:30 p. m. and 7 p. m. until 11:59 p. m. On the suburban lines the tickets will be accepted in part payment of fares and with the addition of 5 cents in cash will be good for passage across the Eads Bridge to St. Louis during non-rush hours.

The innovation resulted after several weeks of careful study of railway conditions in St. Louis, East St. Louis and other large cities. It was found that from 6 a. m. to 8 a. m. and from 5 p. m. to 7 p. m. the railway facilities are often overtaxed, while travel is light at other times.

Attention! National Safety Council Members

THERE was a wave of new members during the month of May. Going along from day to day, we are apt to forget how great the power behind the safety movement has grown to be. Yet when the need arises the membership behind the National Council grows beyond all expectations.

We are growing—eight out of the last ten months have shown an increase in members over the same months of the year before. Nothing can stop us from continuing our growth; eventually the safety movement will reach every person in the United States. Real loyalty, one of the finest things about the National Council, will take care of that.

All of us know that we are dependent on the members we now have to get new members. Will you use your influence to add to our size and to the strength of the safety movement? Will you take the application with you and go out and see a prospect?

WALTER G. KING,
President.

Wage Agreement in Winnipeg

A three-year wage agreement effective May 1 has been reached between the Winnipeg Electric Company, Winnipeg, Man., and its trainmen. It provides a general increase to motormen, conductors and bus men of 1 cent an hour, with an annual increase thereafter of 1 cent an hour, until the former maximum rate of 60 cents an hour to two-man operators is re-established on May 1, 1929. A. W. McLimont, president, made the proposal to the men. He said that he had in mind the necessity for stabilizing relations between the company and its employees and thus obviating the necessity of annually discussing wages or appearing before boards of arbitration or conciliation, with resultant loss of time and effort to both parties. He said he now looked forward "to three consecutive years of wholehearted co-operation between men and management."

Line from Grand Rapids to Jenison to Open Up

Officials of the United Suburban Railway, Grand Rapids, Mich., successor to the defunct Grand Rapids, Holland & Chicago Railway, announce that the Michigan Public Utilities Commission has approved the new company's organization and that operation of cars between Grand Rapids and Jenison, the two terminals of the new road, will be started by June 15. The opening of the new road, which will partly replace the old Holland division of the Michigan Railways, will be the signal for a public celebration that is being arranged by the Grandville Business Men's Association. The officials announce that Gov. Fred W. Green will be invited to officiate as motorman on the first car to be run over the new line, and invitations will be extended to merchants and citizens at all points along the route. Grand Rapids business men and state officials are expected to be guests.

At a meeting of the directors on June 3 the trolley wires were ordered to be replaced and everything put in readiness for immediate operation. This action was taken to anticipate the arrival of five used cars recently purchased in New York that have been remodeled and are expected from the East at once. The operating company is composed of 700 residents in the different communities served. It has 7 miles of double track and will operate through Galewood, Burlingame and other places en route to Jenison.

Omaha Franchise Debated

All efforts to compromise the matter having failed, the City Council of Omaha, Neb., has appropriated $5,000 to finance the defense of the city in the suit brought in federal court by the Guaranty Trust Company, New York, representing the bondholders of the Omaha & Council Bluffs Street Railway, to test the question of whether the company has a perpetual franchise. The city maintains that the franchise is a terminable one and will shortly expire. The money appropriated is to enable the city attorney to employ other competent legal help, since Corporation Counsel Lambert has resigned.

Recent Bus Developments

Bus Route in Jamestown to Replace Car Service

A proposal to abandon the present Lakewood street car line out Fairmount Avenue and replace it with a bus route from Jamestown, N. Y., to Lakewood was laid before the City Council on June 6, when the Jamestown Motor Bus Transportation Company and the Jamestown Street Railway made formal application for a franchise for the new bus route. A public hearing on the application will be held by the Council on June 17. Meanwhile the transportation companies will seek the consent of the Public Service Commission to abandon the trolley line and will request the village of Lakewood for a bus franchise. It is proposed to have the new bus route in operation by July 1.

In the application for the franchise Marion H. Fisher, attorney, explained that the decision of the street railway to abandon the old Fairmount Avenue line to Beechwood and Lakewood had been contemplated for some time because the line had been losing money. The necessity for repaving the company's tracks in Fairmount Avenue had brought the question to a head.

The new line, Mr. Fisher explained, will become a part of the present street car and bus transportation system and the same rate of fares, with transfer arrangements that now exist, will be applied. Three new buses will be purchased, two of them to be used on the Lakewood line and the third to augment the city transportation system.

Chicago Motor Coach Officials Favor Traction Unification Plans

In the discussion of ways and means to bring about unified operation of the various local transportation systems in Chicago in conjunction with a final settlement of the problem, inclusion of bus lines has been taken for granted. The enabling bills prepared by the railways and introduced in the Legislature permit, but do not make obligatory, operation of buses by the new company to be formed to operate the surface, elevated, and subway lines when built.

Although no formal statement of their attitude toward the unification plan has been made by the Chicago Motor Coach Company officials, it is understood that the company is generally in accord with the plan as developed by the surface and elevated lines executives. The terms on which the bus properties would be taken over by the consolidated company have not been evolved.

According to John A. Ritchie, president, the business of the Motor Coach Company has been developing favorably this year, with gross income for the first four months of $1,766,220, compared with $1,559,865 in the corresponding period of 1926, and net income totaling $133,205, or more than three times the $39,921 of net income for the first third of last year.

Mr. Ritchie and other officials are of the opinion that unification of transit facilities offers the best solution of the local transportation problem. Their own plan for substitution of buses for street cars under a twenty-year franchise, which was presented to the City Council last November, probably will not be pushed, if the present traction bills meet with legislative and popular approval. They believe that the motor coach will serve two main purposes in such a consolidation: (1) Transportation on boulevards, in parks and other sections of the city not reached by electric cars, and (2) operation as a feeder to elevated, surface and subway lines.

Definite Action Awaited in Columbia

The transportation problem in the city of Columbia, S. C., has reached a stage where definite action by the City Council is imperative. The matter has grown more complex since March 11, when the cars of the Columbia Railway, Gas & Electric Company ceased to function.

The service had been discontinued without notice to the Railroad Commission. Complaint was made and the utility company was ordered to show cause before the commission why service should not be resumed. Following a hearing an order was issued requiring the railway to resume operations March 31. The company asked for a rehearing and filed a petition for permission to discontinue permanently the operation of railway service in Columbia and to surrender its franchise. The petition was granted by a majority of the commission, and now the Attorney-General has asked that further hearing be had in order that additional testimony may be taken.

Lack of patronage was assigned as the reason for the discontinuance of trolley service. Before the cars were removed the Carolina Transit Company began operating buses, interchangeable transfers being used with the street cars. After the street cars were abandoned bus service was expanded and soon a score of machines, each of 29-passenger capacity, were operating. Meanwhile the 10-cent jitney, a considerable factor in cutting down the revenue of the street cars, was operating everywhere, running in front of and behind buses, picking up passengers and cutting deep into the prospective revenue of the bus company. The bus concern began losing money and became more and more involved as it began to limit its service and as the number of unrestricted jitneys increased.

Now the bus company has made a definite proposal to the City Council —either the jitneys must be kept off the streets on which the buses run or the buses will discontinue operations, and Columbia, which a few months ago had three systems of transportation—the street car, the bus and the jitney—will find itself with only one, the jitney.

Creditors of the bus company have agreed not to bring receivership or bankruptcy action against the bus company for a period of time, and the company from which the buses were purchased has agreed to take over the operation of the bus lines until it can work itself out of the bog. But that company will not take over the buses until the City Council passes an ordinance throwing some sort of restrictions around the operation of the 10-cent jitneys. The Council has not yet taken any action in the matter, though it has under consideration an ordinance which would give the desired protection to the bus company.

Motor Coaches to Replace Stamford Trolleys

A squadron of fourteen large city-type motor coaches left the shops at Long Island City on June 9 and, after parading the length of Fifth Avenue, Manhattan, headed toward Stamford, Conn., where they will go into service at 7 a.m. on June 12, replacing trolley cars of the New York & Stamford Railway.

The coaches will forge another link in the County Transportation Company's projected motorization of all interurban and local trolley lines serving Stamford, Sound Beach, Greenwich, Cos Cob, Mianus, Put's Hill and Chickahominy in Connecticut, and Portchester, Rye, Harrison, Mamaroneck, Larchmont, Larchmont Gardens, Larchmont Manor, Rye Beach, Oakland Beach, Milton Point and New Rochelle, all in the Long Island Sound section of Westchester in New York State.

Garage facilities for upward of 80 buses have been installed at Portchester on the site of the carhouse of the New York & Stamford Railway.

Although Portchester locally is served exclusively by the motor coaches, local officials have not yet consented to permit the County Transportation Company to operate motor coaches over the main-line trolley right-of-way, which passes through Portchester en route from Stamford to New Rochelle. The main-line trolleys will therefore continue to operate from the Connecticut border southward to New Rochelle, while the motor coaches will operate between Stamford and the state line. For the present, at least, passengers will transfer from trolley to motor coach or vice versa at the bridge which marks the state border.

The fare will be 10 cents per zone, or 20 cents from Stamford to the state line, as compared with the trolley rate of 7 cents per zone, with approximately three zones between Stamford and the state line.

The delay in Portchester's consent to the operation of interstate coach service over the main-line trolley right-of-way is apparently the only remaining barrier to the complete abandonment of the railway system and installation of motor coaches on all the routes now covered by the trolley lines.

Action on New York Franchises Again Postponed

The Board of Estimate of New York City on June 3 again postponed action on applications for bus franchises. When the bus franchise item was reached on the calendar, Borough President John A. Lynch of Richmond, believed to be one of Mayor Walker's supporters for a grant of a franchise for Manhattan, Brooklyn and Queens to the Equitable Coach Company, moved that it go over for one week. There was no objection to the postponement. After the meeting, it was said the deadlock in the board on the granting of bus franchises was apparently so pronounced that there was little hope of action before the fall.

Rights Granted Utah Company

A certificate of convenience and necessity, permitting it to operate as a common carrier by rail and by stage between Ogden, Utah, and the Utah-Idaho state line and intermediate points, has been issued to the Utah-Idaho Central Railroad by the Public Utilities Commission of Utah. The company also was granted permission to operate a bus line for the transportation of passengers over the streets of Logan, Utah. All the rights and privileges formerly enjoyed by the old Utah-Idaho Central Company were granted to the Utah-Idaho Central Railroad in the certificate.

Buses to Replace Trolleys. — The Board of Public Utility Commissioners of New Jersey authorized on May 28 abandonment of trolley service by the Public Service Railway between Main and Day Streets, Orange and Elm Streets and Bloomfield Avenue, Montclair. Buses will be substituted.

Replace Cars Temporarily. — The Carolina Transit Company, a bus company operating out of South Carolina, has established a bus line at High Point, N. C., to replace the North Carolina Public Service Company, operator of the electric railway system in that city. According to officials of the company, the replacement of bus service by railway service is only a temporary arrangement, it having been mutually agreed to give the bus concern an opportunity to furnish the transportation service. The company has six buses in High Point, five of which are operating on twenty-minute schedules and one of which is used for reserve. Four of the bus lines traverse the same territory as the railway, while one bus operates on a crosstown route.

Decision Withheld Following Hearing. — The Public Service Commission held a public hearing on June 7 on the petition of the Capitol District Transportation Company, Inc., for permission to operate a bus line between the cities of Albany and Rensselaer. This company is a subsidiary of the United Traction Company.

Two Buses Serve.—The Rockford & Interurban Railway, Rockford, Ill., has placed two buses in daily operation connecting Beloit, Janesville and Rockford. Tickets are interchangeable between the two types of vehicles.

Financial and Corporate

Commission Will Approve Purchase of Baltimore Interurban

The acquisition of a controlling interest in the Washington, Baltimore & Annapolis Electric Railroad, with headquarters in Baltimore, by the Consolidated Gas, Electric Light & Power Company, also of Baltimore, will be approved by the Maryland Public Service Commission. The announcement of the plan to approve the deal was made after the commission had held a hearing on the subject on June 3.

The petition filed by the Gas & Electric Company requested that the commission approve its purchase of 45,433 shares of capital stock of the railroad through the medium of a holding company. More than $1,000,000 is involved in the transaction.

In acquiring the road the Gas & Electric Company will take over 54 per cent of the total stock. It also, as a part of the transaction, will acquire the Annapolis & Chesapeake Bay Power Company, a subsidiary of the railroad serving the residents of a large part of the territory between Baltimore, Washington and Annapolis with electric current.

In testifying before the commission Herbert A. Wagner, president of the Gas & Electric Company, said that the company had no intention of disposing of the property. He said the service will be improved still further and that efforts will be made to increase the freight traffic.

Stock in Mitten Investment Corporation Issued Publicly

Formation of a $50,000,000 investment concern whose stock at a par value of $25 was offered to the public on June 6 was announced in Philadelphia on June 4 by Mitten Management, Inc. The new organization is to be known as the Mitten Bank Securities Corporation.

The full authorized capital is $50,000,000, but the amount of the first stock issue has not been determined. Proceeds of the paid-in capital will be used for purchasing stock of the Mitten Men and Management Bank and Trust Company, the Philadelphia Rapid Transit Company and other concerns which Mitten Management, Inc., may operate.

The entire capital will be issued as common stock with full voting powers and with no fixed dividend rate. An official statement says:

> Mitten Bank was formed for the express purpose of providing a banking service for these new capitalists, (P.R.T. employees) and to meet their desire that the same advantages might be extended to other workers, to the end of helping labor to become capital. Within the past year the stock of Mitten Bank has increased to nearly three times its original price.
>
> The money paid in on Mitten Bank Securities Corporation will be largely devoted to Mitten Bank and its facilities and kindred activities, and to investments in and producing increased economic efficiency for P.R.T. and for other promising properties. All the profits will go to the Mitten Bank Securities Corporation stockholders.
>
> Nothing would please us more than to sell one share to every man, woman and child in Philadelphia. Such a wide distribution would advance the Mitten idea, which is to promote industrial democracy by spreading more widely the profits of industry.

T. E. Mitten, chairman of the board of the Philadelphia Rapid Transit Company, made the following statement:

> Here is an opportunity for the public to own a part in the Mitten Bank and to participate in industrial, financial and public utility undertakings offering safe and profitable possibilities, assured of effective direction through the supervision of Mitten Management, whose policy of enabling the workers to participate in profits earned by increased efficiency not only insures the investment against loss by strikes and poor workmanship, but helps to establish a better order of society through labor becoming capital.

Traffic Fare and Wage Figures

Electric railway passenger traffic decreased slightly in April, 1927, compared with April, 1926. The number of revenue passengers, including bus passengers, reported to the American Electric Railway Association by 216 companies is as follows:

April, 1927	835,658,373
April, 1926	837,210,029
Decrease, per cent	0.19

Average cash fare in cities of 25,000 population and over:

	Cents
May 1, 1927	7.8304
April 1, 1927	7.8194
May 1, 1926	7.6689

Average maximum hourly rates paid motormen and conductors in two-man service by companies operating 100 or more miles of single track:

	Average Hourly Rate, Cents	Index Number 1913=100 Per Cent
May 1, 1927	57.09	209.50
April 1, 1927	56.97	209.06
May 1, 1926	56.72	208.15

Bonds Coming In for Terre Haute Change

At the close of business on June 1 91 per cent of the first and refunding mortgage 5 per cent bonds of the Terre Haute, Indianapolis & Eastern Traction Company, Indianapolis, Ind., had been deposited with the committee representing these bonds. There are eleven other classes of securities involved in the reorganization and of all classes together there has been deposited 83 per cent. One committee has yet to act on the plan before it is declared operative, after which it goes to the Indiana Public Service Commission for approval.

Under the terms of the plan, the securities of the companies to be merged will be exchanged for those of the Indiana Electric Corporation, an Insull company, the 5 per cent bonds of the Terre Haute, Indianapolis &

Eastern Railway receiving in exchange, par for par, a 5 per cent first mortgage and refunding gold bond of the Indiana Electric Corporation. This company has outstanding 6 per cent and 5½ per cent bonds under this mortgage, the former being quoted around 104 and 105. The Terre Haute, Indianapolis & Eastern 5s have continued to pay their interest and are quoted at about 89.

Expansion in Bus Business Improves Capital Traction Status

In his report to the stockholders for the year ended Dec. 31, 1926, John H. Hanna, president of the Capital Traction Company, Washington, D. C., states that it is encouraging to note that for the first time in several years an increase over the preceding year is shown in passenger revenue, accompanied by a slight reduction in operating expense. He said the gain in revenue was small and attributed it to the expansion of the bus business. Receipts from rail operation alone showed a slight loss. Net earnings for 1926 fell slightly under the requirements for a 7 per cent dividend, but the directors felt themselves justified in using undistributed surplus of past years to make up the small deficiency.

Net additions to capital accounts were $39,652. A credit of $63,821 to cars and car equipment was due to scrapping 122 obsolete cars and writing off the remaining ones to junk value.

On the subject of depreciation, the report states that the commission directed a change in the basis of accruing depreciation reverting to the lives of property and annual rates contained in the valuation order of September, 1919. Under the revised plan the company accruals through operating expense were $361,834, a reduction of $36,750 from the preceding year. The reserve increased during the year from $2,458,455 to $2,716,657. Tax accruals were $399,651, an increase of $13,407 from the preceding year.

Bus operations were carried on at a loss of $62,872. Mr. Hanna states, however, that this form of transportation renders an important service and the buses produce, as feeders, much revenue to the rail lines. No new lines were established nor any extensions made except the Hains Point sightseeing line in Potomac Park, operated in the summer only. This line showed a profit. Chartered bus business showed a substantial gain in gross and net revenue.

SUMMARY OF OPERATIONS OF THE CAPITAL TRACTION COMPANY FOR YEAR ENDED DEC. 31

		1926	1925
Passenger revenue, railway..		$4,415,319	$4,482,040
Bus revenue..............		174,631	81,877
Special car revenue.........		48	60
Special bus revenue.........		3,822	95
Total revenue from transportation..............		$4,593,821	$4,564,073
Revenue from operation other than transportation.....		23,165	22,982
Railway operating revenue..		$4,616,986	$4,587,055
Operating expenses (66.70 per cent of gross revenue)		3,100,148	3,110,085
Net operating revenue....		$1,516,837	$1,476,969
Taxes assignable to transportation operations....		399,651	386,243
Operating income........		$1,117,186	$1,090,725
Non-operating income......		31,085	33,132
Gross income............		$1,148,271	$1,123,858
Deductions from gross income:			
Interest on funded debt.........	$280,300		
Interest on unfunded debt..	47,098		
Rent for leased road	13,692		
Income tax paid at source.......	4,317		
Total deductions.........		345,408	335,392
Net income..............		$802,862	$788,465
Profit and loss statement:			
Credits:			
Balance at beginning of year..	$1,478,246		
Net income for the year......	802,862		
Guaranty fund deposit with District of Columbia charged as an operating expense in prior years...	2,500		
		$2,283,608	$2,318,246
Debits:			
Dividends......	$840,000		$840,000
Additional federal income and other taxes for prior years...	32,967		
		$872,967	
Credit balance at close of year.................		$1,410,641	$1,478,246

REVENUE AND TRANSFER PASSENGERS CARRIED BY THE CAPITAL TRACTION COMPANY

	1926	1925
Railway passengers:		
Number of passengers carried at 8 cents..............................	17,719,054	16,995,347
Number of passengers carried at 6¼ cents..............................	43,128,140	45,066,128
Number of passengers carried at 5 cents..............................	830,780	833,352
Number of passengers carried at 3 cents..............................	383,007	345,131
Number of cash passengers carried on Kensington line..............	110,896	119,757
Number of ticket passengers carried on Kensington line..............	46,130	52,547
Total railway revenue passengers..............................	62,218,007	63,412,262
Bus passengers:		
Number of passengers carried at 25 cents..............................	343,899	71,466
Number of passengers carried at 10 cents..............................	64,814	1,160
Number of passengers carried at 8 cents..............................	310,085	252,588
Number of passengers carried at 6¼ cents..............................	528,022	466,617
Number of passengers carried at 5 cents..............................	60,511	640
Total bus revenue passengers..............................	1,307,331	792,471
Total revenue passengers railway and bus..............................	63,525,338	64,204,733
Other passengers:		
1-cent intercompany transfer passengers..............................	2,814,693	2,759,208
2-cent bus to car transfer passengers..............................	556,225	344,011
2-cent car to bus transfer passengers..............................	374,550	310,712
2-cent Eastern High School ticket passengers..............................	8	4
Free transfers passengers..............................	16,982,373	17,111,342
Other free passengers:		
Employees..............................	709,610	727,894

* Exclusive of policemen and firemen while in uniform.

Dividends Resumed in Duluth

The Duluth-Superior Traction Company, Duluth, Minn., has declared a dividend of $1 a share on its common stock, the first distribution to be made for some time on this issue. The regular quarterly dividend of $1 on the preferred stock was also declared.

Abandonment on Detroit United Line

Permission to abandon service on the Wyandotte and Trenton division of the Detroit United Railway, Detroit, Mich., has been granted the receiver, A. L. Drum, by William S. Sayres, Jr., master in chancery in the federal court. Service is being withdrawn and the tracks removed in order that the County Road Commission can carry out proposed paving operations south of Wyandotte. It was stated by the receiver that abandonment of service was due to financial losses attributed to jitney competition.

Abandonment of another branch of the interurban lines is urged in a petition made by the receiver, naming the Romeo-Imlay City branch, consisting of about 20 miles of trackage. A hearing on this proposed abandonment has been held before the standing master in chancery of the federal court and it was announced that a recommendation to abandon the line would be made to Judge Charles C. Simons. It was set forth that the line lost about $29,000 last year, due to lack of patronage and to competition of bus service, making it a serious drawback to the entire Detroit United system. It was Mr. Drum's opinion that if forced to continue in service this year the loss would probably be greater than that experienced previously. Citizens of Romeo, Imlay City and other towns along the route are to be permitted to voice their protests at a hearing to be held in the near future.

Sale of Morris County Traction Authorized

Sale of the property of the Morris County Traction Company, Dover, N. J., was authorized in an order signed on May 7 by Federal Judge Runyon. Elmer King, counsel for Joseph P. Tumulty and Joseph K. Choate, receivers, applied for the sale. The court named Charles F. Lynch, former federal judge, special master to conduct the sale. No date has been fixed for the sale. It will be advertised for at least four weeks.

Assets of the company will be offered in four lots. One will be the right to operate bus lines, another will include the right to operate railway lines and other rights under this franchise, the third lot will comprise the real estate and the fourth the personal property and equipment.

A minimum offer of $200,000 was fixed by the court in the sale order. This sum represents taxes and other priority liens. Any sum above that figure will be used to pay off some of the $3,750,000 in claims of mortgage and bond-holders.

Net Income Higher.—For the ten months period ended April 30, 1927, the total operating revenue of the Brooklyn-Manhattan Transit System, Brooklyn, N. Y., was $38,659,434, against $37,084,474 for a similar period ended the year previous. Total operating expenses increased from $24,158,645 to $25,095,326 in the 1927 period. After the consideration of income deductions, a net income remained of $5,188,965 against $4,631,470 for the ten months ended April 30, 1926.

One Line to Be Abandoned.—The line of the Warren Street Railway, Warren, Pa., operating between that city and the village of Sheffield, Pa., is to be abandoned, according to announcement made public by J. P. Fenstermacher, general manager at Warren of the Penn Public Service Corporation, which owns the line. The company also operates several loops in the city of Warren and an interurban line between Warren, Pa., and Jamestown, N. Y.

Net Income Lower. — For the four months period ended April 30, 1927, the passenger revenue of the United Railways & Electric Company, Baltimore, Md., was $5,424,915, against $5,510,614 for a similar period in the year previous. The net income was $242,228, against $281,708 in 1926.

Proceeds of Bonds for Bus Purchase.—In a supplemental order, the California Railroad Commission has authorized the Key System Transit Company, Oakland, Cal., to use $136,223 of the proceeds received from the sale of first mortgage 6 per cent gold bonds of series "D" to reimburse its treasury for the purchase of fourteen 26-passenger buses and other expenditures made prior to Dec. 31, 1926.

Would Suspend Service.—The Key System Transit Company has applied to the California Railroad Commission for permission to abandon car service between San Lorenzo Junction and East Fourteenth Street, known as the San Lorenzo branch line, in the county of Alameda. Abandonment is sought because the revenues are insufficient.

Partial Discontinuance in the Berkshires.—Through electric railway service between Bennington, Vt., and Hoosac Falls, N. Y., was discontinued on May 31 by the Berkshire Street Railway in accordance with orders issued by the Vermont Public Service Commission. This line was constructed 30 years ago by the Hoosac Falls Street Railway and was operated by that company until 1906, when it was acquired by the Berkshire Street Railway.

Surface Lines Traffic Shows Increase.—Increased riding on the cars of the Chicago Surface Lines has been reported for the twenty-third consecutive month compared with the corresponding month of the previous year. During April there were 132,604,753 riders, an increase of 1,151,854 over April, 1926, but a decrease of 4,422,574 below the preceding month. A total increase of 11,879,805 rides is shown for the first four months of this year. Divisible receipts of the companies after expenses, taxes and interest on purchase price in April were $398,114, against $387,898 in March and $308,417 in the corresponding month of 1926.

Book Reviews

Manual of Endurance of Metals Under Repeated Stress

By H. F. Moore, research professor of engineering materials, University of Illinois. New York, N. Y.: Engineering Foundation.

In 1919 the National Research Council, the University of Illinois and the Engineering Foundation joined forces to consider the problem of fatigue of metals. A number of industries cooperated in helping the undertaking by contributing funds, materials and information for the investigation. The information obtained has been collected, condensed and put in form convenient for engineering use. Most of the investigations are being continued and much research work remains to be done. Some work is needed of more fundamental character than any yet accomplished in order to determine the nature and the general laws of fatigue phenomena.

Some of the subjects treated include a historical review, machines and specimens for testing fatigue strength of metals, determination of endurance limits from data of fatigue tests, values of endurance limits for metals, stress raisers and fatigue failures in service. As the subtitle proclaims it, the book is a summary of views and test data, with instructions for their use.

Psychology of Selecting Men — New Second Edition

By Donald A. Laird. New York, N. Y.: McGraw-Hill Book Company. 345 pages. Price, $4.

This is the second edition of a scientific coverage of the fundamental consideration in selecting men. In this edition chapters have been added which point the way for the employment department to utilize definite tests in the selection of applicants. The contents include such headings as "Character Reading," "The Applicant's Industrial History," "The Limitations of Psychological Tests," and "The Emotional Make-up and Job Adjustment."

Doing Export Business

Compiled by Foreign Commerce Department of Chamber of Commerce. Washington: Chamber of Commerce. 64 pages. Price, 15 cents.

A new, concise, indexed guidebook for the American exporter has been published by the foreign commerce department of the Chamber of Commerce of the United States under the title "Doing Export Business."

Many manufacturers looking overseas for new markets have felt the need for some general survey of what considerations were actually involved in undertaking such a merchandising venture outside the United States. The apprehension of American producers over the intricacy and dangers of foreign marketing are allayed by the statement that:

> This class of business is similar in its main outlines to domestic business. Mastering the special requirements of export trade has not been found a difficult task by those who have set about it seriously.

The booklet then discusses the procedure necessary in surveying the export field, in establishing the export department, in promoting foreign sales and in filling export orders. The book's 185-item index indicates the comprehensive treatment of export business found within its 64 pages.

The Evolution of Overhead Accounting

Compiled by Department of Manufacture of Chamber of Commerce. Washington: Chamber of Commerce.

Fundamental principles to be taken into account by manufacturers in the proper treatment of overhead costs are set forth in a pamphlet, "The Evolution of Overhead Accounting," just issued by the department of manufacture of the Chamber of Commerce of the United States. It is intended to be useful to manufacturers in all lines.

"It is now generally recognized that overhead is the most important factor in cost accounting," the foreword states "Yet, until comparatively recently, even with improved methods in accountancy, the overhead content in the cost of a commodity has been roughly estimated or guessed at. Increasing competition, refinements in machinery and production methods and intelligence used in management have brought to the front the problem of more accurately measuring overhead."

Aware of the confusion among manufacturers over treatment of overhead, the chamber's department of manufacture has just completed a special study of the best methods of accounting procedure. The material developed is used as a basis for the pamphlet.

There are two divisions to the pamphlet. The first is devoted to the history of overhead accounting, showing various stages in the development of modern practice in such manner as to make clear the fundamentals in the accounting that are today recognized as important. Part second offers some suggestions to the manufacturer who wishes to improve his accounting procedure. E. W. McCullough, manager of the chamber's department of manufacture, announces that a copy of the pamphlet will be sent to any executive requesting it.

A Small Stockholder

By John T. Broderick. Schenectady, N. Y.: Robson & Adee. 127 pages. Price, $2.

Still another book has been added to the growing list of titles on investments and investment subjects intended for the general reader. This is auspicious, particularly since it is estimated that there are 7,000,000 stockholders in the United States, many of them small investors. There is no particular need, in a review of this kind, to go over the ground of the increasing growth of ownership in industry by the general public, but despite the lengthening list of books on investment intended for general consumption the subject has not been overdone.

The student of finance and the man of affairs might find the present volume too elementary for them, but there is a large class of investors, particularly employee-investors, who will find a perusal of its contents helpful and suggestive. And this is the class that needs the advice most. Having made a successful investment in the company with which he is connected, the employee often is easily intrigued into making other financial commitments which do not stand the test of time, either long or short. That is where the contents of this volume have their greatest value. One may or may not agree with the plan of the author suggesting a national association of stockholders, but one must agree, it seems, with the suggestion that the present volume is one that the individual employee-stockholder may well own to his own profit, and that the volume is one that should be on the shelves of the public libraries and in the reading rooms for employees. All this is said despite the fact that some statements of opinion in the volume are subject to challenge, not because they are understatements, but more because they are overstatements.

Facts and Figures of the Automobile Industry, 1927 Edition

National Automobile Chamber of Commerce. 96 pages.

In this eighth annual edition a number of facts and special studies are made available for the first time. Some interesting statistics, charts and maps are included to give the history of the automobile industry in the United States. The associations of that industry are listed with their main offices and officials. A motor bus table shows that electric railways and subsidiaries operated 7,284 buses as of Jan. 1, 1927.

Standards Year Book, 1927

National Bureau of Standards, U. S. Department of Commerce. 392 pages. Price $1.

The Standards Yearbook represents an effort to present an adequate picture of the diversification and ramification of the standardization movement which has spread throughout the world with astonishing rapidity during the 25 years that have elapsed since the establishment of the U. S. Bureau of Standards. It contains outlines of the activities and accomplishments of not only this bureau and other agencies of the federal government and the states and municipalities, but also of the American societies and associations of which standardization is a major or very important activity. As a companion volume to Commerce Yearbook, which deals strictly with industry and commerce, the Standards Yearbook deals strictly with standards and standardization. In this volume are correlated the essentials concerning standardization activities with which the Bureau of Standards is in close co-operation, and the subject of standardization is presented in its entirety. The Standards Yearbook will furnish the answers to a great volume of urgent inquiries received by the Bureau of Standards from manufacturers, industries experts, engineers and purchasing agencies, both governmental and general.

Forecasting Business Conditions

By Charles O. Hardy and Garfield V. Cox. New York, N. Y.: The Macmillan Company. 434 pages. Price, $4.

This book concerns itself with the study of those recurrent business maladjustments known as crises and depressions, considered not so much from the viewpoint of public economy as from that of the practical man of business and the investor. The book is made especially valuable by the study of the methods and forecasts of several well-known economic agencies, in so far as their work has to do with prediction of changes in general business activity. The various indices of production are discussed as well as the indices of employment, trade and business activity.

Tips on Leadership—Life Stories of 25 Leaders

By Herbert N. Casson. New York, N. Y.: B. C. Forbes Publishing Company. 224 pages. Price $2.

Men who aspire to become commercial magnates will welcome Mr. Casson's recipes for success in the business world. For some 60 pages he imparts hints on how to reach the top and wield the influence of the big business man. Then he tells the stories of 25 outstanding leaders who had a worthy purpose, were imbued with the spirit of independence and considered defeats as lessons. They are to serve as models for the impatient young American youth who, too, wants to become a leader.

If Mr. Casson appears to be platitudinous at times it is only because he, himself, has so firm a belief in the efficacy of these hints. His opening remarks on the necessity for quick decisions in a true leader are worthy of thought. He says: "A leader must reflect, he must plan, he must think. But he must not be like Rodin's 'Thinker'—sitting still and absorbed in his own reflections." Men intrusted with the management of utilities might read with profit his chapter "Reward Loyalty." Here are a few of his ideas:

> If an employer has men and women who have worked loyally for him for twenty years, and if he gives them nothing—no reward, no diploma, nor any sort of public praise, how can there be any loyalty in that firm?
>
> Are there not some firms that are forever changing their staff? Employees are always coming and going. Why? Because they are not fastened to the firm by loyalty.
>
> We have been hearing a good deal, in recent years, about labor turnover—the cost of new employees.
>
> We know now that a new employee costs from $50 to $200, what with the training and the loss by bad work and one thing and another.
>
> So you can see that loyalty is necessary and profitable. You can see that it is just as important as efficiency.

However, acceptance with considerable reservation is made of Mr. Casson's thoughts on learning to make news. That a leader must always be in full view and that no man can be a leader and a modest violet falls a little short of truth and idealism. "Be with the crowd and let them know where you are" is his tip for would-be leaders. Mr. Casson says: "If you have a dread of publicity, then sell out and live in retirement among your roses and rhododendrons and other dumb things." Not every one would consider roses and rhododendrons among dumb things.

The second part of the book contains an analysis of 25 personalities noted for their leadership. The list includes George Westinghouse, James Watt, Thomas A. Edison, Andrew Carnegie, Henry Ford, Elias Howe, Luther Burbank, Sir Isaac Newton and Thomas Huxley.

Occasionally the light and dark effects in Mr. Casson's pictures are a bit disconcerting. Doesn't Mr. Casson believe that more than Mr. Carnegie's heart would have been affected by the marriage of his daughter to a duke? Again, our credulity is strained when Mr. Casson remarks that Luther Burbank was so absorbed in work that he did not marry until the age of 71.

Undoubtedly the railway man knows a great deal of the life of George Westinghouse, but Mr. Casson's résumé will refresh his memory on the aspirations and accomplishments of that always earnest and ofttimes reckless pioneer. Besides, the author has something to say about "love in a railway coach."

"Tips on Leadership" is an earnest effort on the part of a leader in business in this country and abroad to put before aspirants "practical pointers on how to win leadership" His book purports to show the necessity for certain habit formations and character acquisitions if that goal is to be reached.

The "Electrician" Annual Tables of Electricity Undertakings, 1927

Benn Brothers, Ltd., London, England. 194 pages. Price, 10 shillings

This is the 40th edition, revised and containing details of several new undertakings, together with particulars of projected schemes. For the first time a comprehensive index covering the British tables A, B and C has been compiled and the Undertakings are not only set out in alphabetical order but the towns and even parishes receiving supply in bulk are also included. The contents show that colonial undertakings, foreign undertakings and British undertakings are included.

Corporate Resolutions

By Isabel Drummond. New York: Ronald Press. 321 pages. Price $6.

This volume is intended as a handbook for corporation executives, lawyers, accountants and others who are concerned with the management and operation of corporations. It combines a concise analysis of the law governing corporate resolutions, the medium through which corporate authority speaks, with annotated forms covering a wide range of corporate activity. There are 359 resolution forms covering stockholder's resolutions; directors' resolutions pertaining to internal transactions; directors' resolutions affecting third parties, and corporate notices. For convenience in use they are classified and divided into sections in accordance with the law governing stockholders' and directors' powers and the legal requirements concerning notice of action taken or to be taken.

Personal Items

C. O. Weidman in Guilford

C. O. Weidman was appointed general manager of the New Haven & Shore Line Railway, Guilford, Conn., on May 1. He entered the employ of what is now known as the Southern New York Power & Railway Corporation in 1898 and served successively as conductor, motorman, dispatcher and chief dispatcher. After a successful period in these rôles he was appointed superintendent of the property in 1906. Seven years later Mr. Weidman accepted an appointment as superintendent of the Morris County Traction Company, Norristown, N. J., resigning from that position in 1923 on account of ill health. During the next three years he was incapacitated and temporarily relinquished railway work. His next position was with the Altoona & Logan Valley Railway at Altoona, Pa., as superintendent in 1926. He was serving in this capacity when he resigned to accept the post of general manager of the New Haven & Shore Line Railway.

A. A. Hale, Griffin Wheel Vice-President

A. A. Hale, Eastern sales manager of the Griffin Wheel Company, Chicago, Ill., has been elected vice-president of that company. He will continue in the East, with offices in New York, in the capacity in which he has been serving, but with the added prestige which his election as a vice-president of the company carries. That prestige Mr. Hale has been building up with the company and in the steam and electric railway industry over a period of 22 years, for it was in 1905, just after his graduation from the University of Illinois as a mechanical engineer, that Mr. Hale went with the Griffin company.

He started at the bottom, a statement which in Mr. Hale's case means just what it says. The first title he had was mechanical inspector. Then came promotion after promotion, until in 1911 Mr. Hale was sent by his company to Boston as sales agent. For twelve years Mr. Hale circulated among the customers of the company who came under the range of territory included within the jurisdiction of that office. Then in January, 1923, he was sent to New York to represent the company and to operate for it with the title of Eastern sales manager. Few men in the steam and electric railway equipment field are better known than he. He was born in St. Louis, Mo., on May 1, 1883.

Promotions for Federal Light & Traction Men

At the monthly meeting of the board of directors of the Federal Light & Traction Company, New York, N. Y., J. Dunhill, who for many years past has been secretary and treasurer, and John D. Bowles, who for several years past has been chief engineer, were appointed vice-presidents of the company.

Among the subsidiaries of the Federal Light & Traction Company are the Hot Springs Street Railway, Hot Springs, Ark.; the Grays Harbor Railway & Light Company, Aberdeen, Washington, and the Springfield Railway & Light Company, a holding company.

Hugh Edwards Weyman Elected by Canadians

Hugh Edwards Weyman, manager of the Levis Tramways, Levis, Que., and well known in the manufacturing and operating end of the railway business, was elected president of the Canadian Electric Railway Association on June 2, 1927, at the annual meeting held in Winnipeg, Man. A year ago he was elected vice-president.

H. E. Weyman

Early in Mr. Weyman's career he was identified with the Westinghouse Electric & Manufacturing Company, where he took a special student's course, on the completion of which he was appointed foreman of the installation department and later general foreman of the insulation winding and transformer departments. On leaving the Westinghouse company he was engaged as foreman and later as general foreman at the armature winding shops of the Siemens Company, London, England. After some years with this firm he entered the services of the selling agents of the Gardner Oil & Gas Company, as sales engineer. His next position was general foreman of the electrical shops of the Canadian Allis-Chalmers Company, Montreal, and when this company was taken over by the Canadian General Electric Company, he entered the services of the St. Lawrence Bridge Company at the building site of the Quebec Bridge.

Leaving this company Mr. Weyman was engaged by the Levis County Railway and has been with it for the past ten years. During this time he has been responsible for the complete rehabilitation of the property, including the reconstruction of the track and construction of new car shops. Through his efforts the first installation of the Birney safety car in Canada was made.

Mr. Weyman was born in Guildford, England, on Aug. 27, 1883. He was educated at secondary schools and Cheltenham College and took the students' course in mechanical engineering and operation with the Great Central Railway.

Reorganization in Oakland

Departments of the Key System Transit Company, Oakland, Cal., have been reorganized, effective June 1, and what is sometimes called the "cabinet system" has been adopted. The changes in the internal organization of the company were made necessary by the resignation of George H. Harris as general manager and the abolition of that office. Under the new arrangement there will be five departments, the heads of which will report direct to Lester S. Ready, president. These departments will be known as and officered as follows:

Operating department, under James P. Potter, for many years superintendent of transportation. He will have charge of the operation of ferries as well as traction, Key division and buses. Capt. W. A. Rasmusen will remain as superintendent of ferries.

Engineering department, under H. P. Bell, who has been with the Key System for fourteen years and who has been chief engineer for the past two years. He will have charge of all construction and maintenance of tracks, equipment and ferries.

Financial department, under C. C. Vargas, who will have charge of all financial matters, auditing, accounting and purchasing. He is one of the youngest executives in the company and was formerly assistant to C. O. G. Miller when the latter was president of the Key System.

Public relations department, under Paul Goldsmith, who is a former Oakland newspaper man. Mr. Goldsmith will have charge of general public contacts, publicity, advertising and kindred matters.

Legal department, under W. I. Brobeck, Piedmont, as chief counsel and the firm of Brobeck, Phleger & Harrison in charge of general legal matters.

F. W. Frost remains as secretary and treasurer, positions he has held for 35 years.

Messrs. Davis and Boiselle in New Territory for Westinghouse Brake

E. W. Davis, for five years representative of the Westinghouse Air Brake Company at Boston, Mass., has been promoted to the position of Southwestern manager of that company with headquarters at St. Louis.

Mr. Davis was graduated from Purdue University with the mechanical engineering class of 1902. After several years of service with the Santa Fe and the Burlington railroads and a number of industrial concerns, including the Westinghouse Automatic Steam

Coupler Company, he entered the employ of the Westinghouse Air Brake in 1908. He was first an inspector, then assistant district engineer at New York. In 1919 he was promoted to be representative of the Westinghouse Traction Brake Company at that point. Since January, 1922, Mr. Davis has served as representative at Boston, a place which he relinquished to assume the more important duties in the Southwestern district.

Raymond Boiselle has been appointed representative of the Westinghouse Air Brake Company at Boston, Mass., succeeding Mr. Davis. Mr. Boiselle received his mechanical engineering education at the University of Illinois and early practical experience with the Missouri Pacific, Santa Fe and Rock Island railroads. Entering the service of the Westinghouse Air Brake Company in 1912, he was employed in the test department until 1917. During the World War he served as first lieutenant and captain, Aerial Armament Division, overseas, then re-entered the Westinghouse ranks as mechanical expert in the Southwestern district, where he remained until appointed representative in the Pittsburgh district in 1923. From this position he was transferred to the Boston office.

Harry G. Taylor has resigned as chairman of the Nebraska State Railway Commission to become director of public relations of the car service division of the American Railway Association, with headquarters in Washington. In addition to his other duties Mr. Taylor has served for several years as chairman of the Central Western Shippers' Regional Board, made up of shippers and railroad representatives, and one of the instruments by which better understanding has been secured between shippers and carriers.

John E. Curtiss, Lincoln, has been named a member of the Nebraska Railway Commission to succeed H. G. Taylor, who resigned to become manager of public relations for the car service division of the American Railway Association. Mr. Curtiss will take charge on July 1 and will serve until a successor is elected in November, 1928. Mr. Curtiss served for seven years as secretary of the commission, but left last fall to take a departmental secretaryship with the Lincoln Chamber of Commerce.

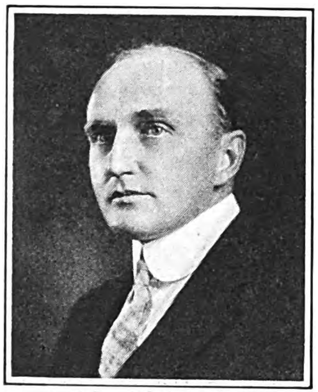
John B. Reynolds, former general secretary of the Indianapolis Chamber of Commerce, has been appointed director of the industrial development department of the Middle West Utilities Company, Chicago, the parent corporation for utilities in the Middle West, many of which are in Indiana, where Mr. Reynolds is well known. Mr. Reynolds was general secretary of the Chamber of Commerce for seven years, but retired in March after that body was reorganized.

James P. Neal, city attorney of Walla Walla, Wash., has been appointed to the post of supervisor of transportation in the Department of Public Works of Washington at Olympia. Mr. Neal replaces O. O. Calderhead, resigned.

Changes Among Mitten Men

Mr. Myers, P.R.T. President, Becomes Securities Official—Mr. Senter to Head Railway

W. K. Myers has tendered to the board of directors of the Philadelphia Rapid Transit Company his resignation as president, effective July 1, 1927, in order that he may devote himself entirely to the position of executive vice-president of the newly organized Mitten Bank Securities Corporation, which has been created as a vehicle through which to advance the Mitten principle of industrial democracy, and stock of which is now being offered to the public.



W. K. Myers

The announcement to this effect was followed by a statement by T. E. Mitten, chairman of the board of the Philadelphia Rapid Transit Company, on June 9 that he would recommend to the board the election of R. T. Senter as president to succeed Mr. Myers.

R. T. Senter

Mr. Myers was born in 1883 at Millville, N. J. He was educated in the public schools of Lancaster, Pa., and was graduated from Pennsylvania State College in the class of 1905. Mr. Myers was actively engaged in electric railway work in Chicago before he went with the Philadelphia Rapid Transit Company in 1919. Prior to his election as president at Philadelphia in 1926 he served as financial vice-president. He has the unusual distinction of combining an engineering training with a thorough financial education and experience. These attributes fit him eminently for the task of directing the destinies of the new corporation, in which the savings of small investors will be reposed.

Mr. Senter has been associated with Mitten Management for twenty-eight years. He is now vice-president of the Philadelphia Rapid Transit Company. Mr. Senter was born in 1876 in Columbus, Ohio. He was educated in the public schools of that city, Michigan Military Academy and the University of Michigan. He received his engineering education at Armour Institute of Technology and his practical experience with the Twin City Rapid Transit Company, International Railway, Chicago City Railway and Philadelphia Rapid Transit Company. During recent years he has specialized in electric railway car design, high-speed planning and subway-elevated construction.

ROSTER OF NEW INVESTMENT COMPANY

As for the newly-formed Mitten Bank Securities Corporation, the roster of its personnel has been announced. In addition to T. E. Mitten, president, and Mr. Myers, other officers of Mitten Bank Securities Corporation are: A. A. Mitten, vice-president; A. A. Chapman, secretary and treasurer; C. E. Ebert, comptroller; D. E. Brown, assistant treasurer. The board of directors is composed of T. E. Mitten, chairman; A. A. Mitten, vice-chairman; W. K. Myers, J. F. Schmunk, Mitten Management's accounting officer; R. T. Senter, A. A. Chapman, S. H. Stout, L. W. Hackett, J. F. Shivers, J. E. Wood, L. R. Skeen, E. H. Naudascher and W. R. Smith. The seven last named are elected representatives of P.R.T. employees.

H. W. Ross has been promoted by the Missouri Public Service Commission from assistant accountant to chief accountant. He succeeds T. J. Murphy, who resigned after thirteen years service with the commission to become connected with the Inland Power & Light Company, St. Louis. Mr. Ross has been assistant to Mr. Murphy for the past four years and prior to that was in the accounting department of the Interstate Commerce Commission.

A. J. Smuts, who has been in charge of the gas properties of the Wisconsin Traction, Light, Heat & Power Company in Neenah and Menasha for the past several years, will also have charge of the transportation properties.

W. H. Henby of University City, Mo., was elected president of the Missouri Association of Public Utilities at its annual meeting in Cape Girardeau, Mo., on May 7.

Charles W. Milner, of the law firm of Humphrey, Middleton & Humphrey, has been appointed assistant general counsel of the Louisville Railway, Louisville, Ky.

Ezra B. Whitman, formerly chairman of the Maryland Public Service Commission and now a member of the commission, has been reappointed to that body by Gov. Albert C. Ritchie.

Manufactures and the Markets

News of and for Manufacturers—Market and Trade Conditions
A Department Open to Railways and Manufacturers
for Discussion of Manufacturing and Sales Matters

Aluminum Car Body Material Shipped to Chicago & Joliet

The Chicago & Joliet Electric Railway, Joliet, Ill., announces the first shipment of aluminum materials for the cars that were to be constructed on the new worm-drive trucks, a detail description of which appeared in the JOURNAL for May 28. Shipment was made from Pittsburgh on June 1 and the balance of the material is expected this week.

"If nothing unforeseen happens," writes J. R. Blackhall, vice-president of the company, "we should have the body ready about Aug. 15, meantime the trucks are in daily operation, having operated about 2,000 miles without the development of trouble of any kind. The motors are performing satisfactorily, notwithstanding the fact that the car body on the trucks weighs about 8,000 lb. more than the new body will weigh."

Haskelite Extensively Used in Lindbergh Airplane

Haskelite plywood, used extensively in the aircraft field and well known in the automobile, truck, marine, bus, electric railway and sign industries, has added a new record to its string. In addition to being used in the Curtiss NC transatlantic planes in 1919, the Douglas world cruisers in 1924 and four Loening good-will planes just returned from South America, it has the honor of forming a considerable part of the structure of the Ryan monoplane used by Captain Lindbergh in his New York-Paris flight.

In the "Spirit of St. Louis" haskelite forms the entire wing structure and the leading edges and is used for almost the entire cabin, as well as other parts of the ship.

Essentials of Modern Car Discussed in National Pneumatic Book

What is an exceptional piece of publicity and at the same time a distinct contribution to the movement for new, or rehabilitated cars is to be found in "The Modern Car," a booklet recently released by the National Pneumatic Company, New York City. In a concise and highly illuminating text the modern car is discussed in its essentials.

First, one reads this splendid conception of the modern car:

> The modern car is one which earns a maximum return on its investment. It is not necessarily a new car. All new cars are by no means modern. Neither are all old cars perfectly obsolete. The modern car, in other words, may be either new or reconstructed, but it must be so constructed and equipped in other parts that it will add in return the highest monetary yield.
>
> It is not enough, for instance, to equip the car with a modern motor if a modern braking system is not simultaneously included. It is not enough to furnish comfortable seats if no simple consideration is given to the heating, light and ventilation. Nor is it sufficient if small wheels and a low floor are specified but no other provisions made for the safe and rapid interchange of passengers.
>
> In all such cases as partial improvement —where improvements can be totally or even partially offset by disadvantages— there is really no forward step. There is no gain in speed, for instance, if fast operation is canceled by slow retardation or delay in handling passengers. The car, in other words, must be completely modern, or it is not truly modern.
>
> New or rehabilitated, therefore, we define the modern car as a car constructed or rebuilt to include and properly combine all modern features of construction so as to derive the greatest benefit from all, when this benefit is measured in net revenue.

The booklet is effectively illustrated. It will be an interesting adjunct to the library of any one interested in the development of modern transportation.

Conference Recommends Remedies

Committee on Industry Summarizes Economic Situations—Pools and Cartels Finalized

BY EDWARD J. MEHREN

Vice-President McGraw-Hill Publishing Company, Inc.

CLOSING its session on May 23 after three weeks of continuous work, the International Economic Conference meeting at Geneva adopted a long series of recommendations on commercial and agricultural topics and three on industrial subjects. How speedily the recommendations can be translated into action, where definite action is proposed, cannot be foretold. Immediate results must not be expected. The issues would require much time even if only national action were required, but there are various agencies for forwarding the work, such as the economic section of the League of Nations, the International Chamber of Commerce, the International Institute of Agriculture, the International Management Institute, etc.

Not all the economic ills of the world were surveyed at Geneva. The pressing question of the disposal of surplus populations was not touched, due to the fact that it is too political. No attention was paid—or practically none—to the economics of distribution, to the problem of decreasing the spread between manufacturing cost and ultimate selling price. To this problem we are devoting much time in the United States. But, as it was, the agenda was crowded and many topics set down received no attention.

CONFERENCE SUMMARY OF SITUATION

In cable messages and previous articles summaries have been given of the economic situation as presented to the conference and of the resolutions which have been adopted. There remains here chiefly to give more completely the resolutions on industrial pools and rationalization.

Before doing so, it is worth while to give the readers of the ELECTRIC RAILWAY JOURNAL an opportunity of reading the conference's own summary of the economic situation, as set forth in the preambles of the report of the committee on industry.

Said the committee on industry:

> The chief difficulties now experienced result from the facts that in certain countries sufficient capital has not been available or that, with existing restrictions and under present conditions, the available markets are inadequate for the productive capacity in a number of the principal industries. This maladjustment results from many causes and takes various forms. There is a maldistribution of plant and equipment. In those countries which participated actively in the war, plant capacity in many industries was increased for military purposes beyond the scale of what is required in peace; in other countries, new plants were installed to produce goods which could not be imported during the war, and the experience of war deprivations has developed a desire on the part of a number of nations to make themselves self-sufficing. Moreover, the general impoverishment of Europe immediately after the war lessened savings and handicapped industry by reducing at once the purchasing power of its clientele and the possibility of financial assistance from European money markets.
>
> Other causes have tended to a new distribution of manufacturing equipment; certain discoveries, for instance, have brought about a change in the use of raw materials or in the utilization of sources of energy and a displacement of industrial centers. The normal development of certain repair and finishing industries in partially industrialized non-European countries and the effort in Europe itself on the part of certain nations with rapidly growing populations to increase their industrial equipment with a view to providing work for an ever-increasing number of individuals have operated in a like direction.
>
> The war indirectly increased the influence of these causes of instability. It increased the desire of various nations to work up in their own territories the raw materials they produced; it augmented the number and the magnitude of the obstacles placed in the way of the movement of goods by tariffs and prohibitions and of the movement of persons by immigration laws, by passport regulations and by restrictions on the right of establishment in the case of foreigners. Finally, the changes made in the structure of the economic organism as a result of alterations in frontiers, the laborious readjustment of international relations and the insecurity of the financial and monetary situation have further retarded or impeded the efforts by which the European nations have endeavored to restore order in their industrial economic life.
>
> Of these causes, some are no longer operative, though their effects may last after them. The danger of great immediate additions to equipment in industries where plant capacity is already excessive is slight in the principal industrial countries; the will to save is being revived and the supply of capital grows steadily; exchange fluctuations are now confined to a few currencies and within much narrower limits than heretofore.
>
> Other causes—which were noticeable before the war—particularly the growth of industries in hitherto only partially industrialized countries, etc., must be considered as permanent and in the new world situation susceptive of direction only within very restricted limits.
>
> It is on a third category of factors that the conference has had to concentrate its attention, namely, those which by their nature can, in existing circumstances, be appropriately modified. Of these the most important are the restrictions and control

of the movement of goods and persons and, above all, those which result from tariff and commercial policy.

Finally, owing to the growing facilities for transport and the constantly increasing number of raw materials required for industrial production, the natural development of industry is toward greater international intercourse and larger international enterprises.

In next week's issue will be carried Mr. Mehren's summation of the resolution on industrial pools and rationalization adopted by the conference.

Heavy Sales of Lead at Better Prices

Not in months has the lead market been so active as during the last week, practically all producers reporting an unusual demand. Total sales of zinc, too, have been unusually large, and prices have advanced another 17½ points. Prompt tin advanced a little, with reasonably good demand. Copper sales have not amounted to anything all week, but prices have held firm; in fact, being slightly higher now than a week ago. A little copper was sold at 12⅝ cents, delivered, June 2, but since then the level has been 12¾ cents, with 12⅞ cents and as high as 13 cents secured in the Middle West. Sales of zinc in the week ended June 8 have been the best in many weeks, June 2 being an especially active day. The London market has advanced proportionately the same amount as has the St. Louis market in the last two weeks. Spot lots of high-grade are nominally unchanged at 8 cents per pound.

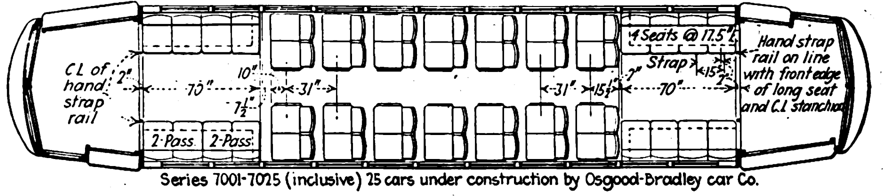
METAL, COAL AND MATERIAL PRICES F. O. B. REFINING

Metals—New York	June 7, 1927
Copper, electrolytic, cents per lb	12.52
Copper wire, cents per lb	15.125
Lead, cents per lb	6.42
Zinc, cents per lb	6.62
Tin, Straits, cents per lb	68.125
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$4.50
Somerset mine run, Boston, net tons	1.875
Pittsburgh mine run, Pittsburgh, net tons	2.05
Franklin, Ill., screenings, Chicago, net tons	†
Central, Ill., screenings, Chicago, net tons	†
Kansas screenings, Kansas City, net tons	2.65
†Quotations withdrawn because of strike.	
Materials	
Rubber-covered wire, N. Y., No. 14, per 1,000 ft	$5.15–5.20
Weatherproof wire base, N. Y., cents per lb.	16.00
Cement, Chicago net prices, without bags	2.05
Linseed oil (5-bbl. lots), N. Y., cents per lb.	11.60
White lead in oil (100-lb. keg), N. Y., cents per lb	14.50
Turpentine (bbl. lots), N. Y., per gal	$0.60

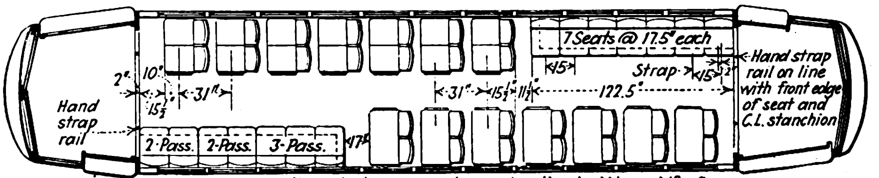
The domestic lead market suddenly and rather unexpectedly came to life late on June 1. The American Smelting & Refining Company has not increased its official contract price in New York from 6.40 cents, even though most of the business was done at 6.45 cents and 6.50 cents. The most active buying took place in the Middle West.

The tin market has been comparatively quiet, with prices steady, because of the limited supply of prompt metal on hand. This applies especially to Straits, which commands a premium of about 4 cents over 99 per cent; likewise, the prompt position enjoys an advantage of 3½ cents to 3¾ cents over futures.

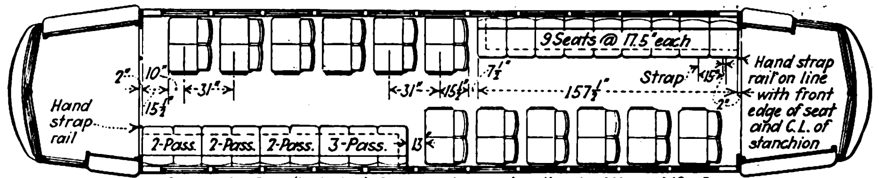
Delivery Progressing on Eastern Massachusetts De Luxe Cars



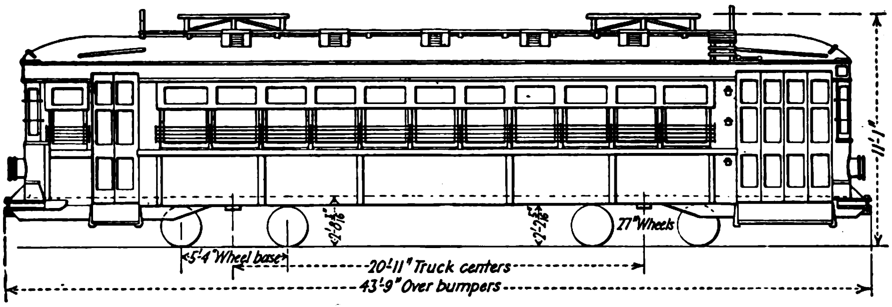
Series 7001-7025 (inclusive) 25 cars under construction by Osgood-Bradley car Co.



Series 7026-7040 (inclusive) 15 cars under construction by Wason Mfg. Co.



Series 7041-7050 (inclusive) 10 cars under construction by Wason Mfg. Co.



Patrons of the Eastern Massachusetts Street Railway will shortly be served by these de luxe semi-convertible units

Final specifications are available for the 50 de luxe semi-convertible, semi-steel cars ordered by The Eastern Massachusetts Street Railway, Chelsea, Mass., on Jan. 5, as noted in ELECTRIC RAILWAY JOURNAL for Jan. 29. The order was equally divided between the Osgood-Bradley Company, Worcester, Mass., and the Wason Manufacturing Company, Springfield, Mass. Each car has a seating capacity of 44 persons, and, as will be noted from the accompanying plans, there is a diversity in the seating arrangement not only between the Wason and Osgood-Bradley units but also in the cars constructed by the former company. Delivery has already commenced and is scheduled for completion on June 15. The details follow:

Number of cars ordered	50
Name of road	Eastern Mass. St. Ry.
Date order was placed	Jan. 5, 1927
Dated of delivery	Starting May 15, 1927; complete, June 15, 1927
Builder of car body	25 Osgood-Bradley Co., 25 Wason Mfg. Co.
Type of car	Semi-convertible passenger
Seating capacity	44
Weight, total (estimated)	35,000 lb.
Bolster centers, length	20 ft. 11 in.
Length over all	43 ft. 9 in.
Truck wheelbase	5 ft. 4 in.
Width over all	8 ft. 2$\frac{11}{16}$ in.
Height, rail to trolley base	11 ft. 1 in.
Body	Semi-steel
Interior trim	Mahogany
Headlining	25 cars Agasote; 25 cars Haskelite
Roof	Arched, ⅞ in. Douglas fir
Air brakes	Westinghouse SM-2, with safety features and variable load device
Armature bearings	Plain
Axles	Standard Steel Co. carbon steel, 3½ in. x 6 in.
Bumpers	Hedley anti-climber
Car signal system	Faraday high voltage
Car trimmings	Statuary bronze
Center and side bearings	Brill
Conduits and junction boxes	Duratube and flexible metal conduit
Control	K-35KK, with hand switch
Destination signs	Hunter illuminated destination, side and front
Door operating mechanism	National Pneumatic Co.
Fare boxes	Johnson
Fenders or wheelguards	Brill
Gears and pinions	General Electric grade M, long and short addendum
Hand brakes	Peacock-National Brake Co.
Heater equipment	24-600-watt Consolidated Electric Service
Headlights	12 in. Golden Glow with fixed focus
Journal bearings	Two cars equipped with Timken roller
Journal boxes	Brill
Lamp fixtures	Dome fixtures, compensated
Lightning arresters	Westinghouse MP
Motors	Four GE-265
Motors	Inside hung
Paint	Pratt & Lambert Vitralite enamel
Registers	International
Sanders	Osgood-Bradley traps, Westinghouse Type "C" sander valves
Sash fixtures	Osgood-Bradley and Wason
Seats	Heywood-Wakefield 327M, with deep cushions and divided backs
Seating material	Brown machine-buffed leather
Slack adjuster	American J-1
Springs	Brill
Step treads	Mason safety treads—Feralun
Trolley catchers	Wilson T-2
Trolley base	Nuttall US-20, roller bearing
Trolley wheels	Ideal, No. 40-A
Trucks	Brill 177-E-1-X
Ventilators	Utility New Era
Wheels	Bethlehem Steel 27 in. rolled steel
Special devices, etc.	¼ in. battleship linoleum flooring; dome lighting fixtures; cabinets inclosing platform piping, etc.
Power-saving device	Economy meters with inspection dials

Municipal Railway Splits $20,000 Trolley Wire Bid

Municipal Railway, San Francisco, Cal., received on June 2 bids on trolley wire to be used for the construction of the Judah Street extension of its lines. The Pacific States Electric Company and American Brass Company were the lowest bidders for the $20,000 contract. President Timothy A. Riordan stated that awards will probably be divided between the two concerns.

Mr. Riordan announced that within the next few weeks bids will be received for the trolley poles for the new Judah Street line, and also for the laying of ties. The ties have already been purchased.

"Miller Medal" Donated by Welding Society

The American Welding Society, through its president, F. M. Farmer, announces the donation of an award, the gift of Samuel Wylie Miller, to be presented by the society annually in appreciation of work of outstanding merit in advancing the art and science of welding. The award is a gold medal, which will be known as the Miller medal.

The donor has been one of the outstanding figures in the advancement of welding ever since its commercial inception. He is a past-president of the American Welding Society and a prominent and active member of the Society of Mechanical Engineers, American Institute of Mining and Metallurgical Engineers and other scientific and engineering organizations. Mr. Miller is consulting engineer of the Union Carbide & Carbon Research Laboratories, Inc.

In establishing this award, Mr. Miller's object is to promote an appreciation of better welding and to encourage the study of those fundamentals which will lead to raising the quality of work done by the average operator.

Rolling Stock

The Terre Haute, Indianapolis and Eastern Traction Company, Indianapolis, Ind., has christened its latest interurban coach "Wiley High School." The car, which recently made a trial run from Terre Haute to Indianapolis and return, reveals a great improvement over other cars now in general service on the line. It was remodeled at the Terre Haute shops of the company. There are dome lights and special reading lamps for the seats. The seats are air-cushioned, non-reversible, covered with moiré plush. Mahogany finish and battleship lineoleum on the floors add to the general appearance of the car. The car has a maximum speed of 70 m.p.h., driven by four 100-hp. motors. It seats 51 persons.

A. E. R. A.

The Bidding is Brisk

85,909 sq.ft. of the de luxe show room space shown in the illustration below had been bid in on June 6 by 160 exhibitors, who were more willing to sign for than be assigned space at the big exhibit. This represents 26 more exhibitors and a 20,718-sq.ft. increase over the same date last year.

Virginia Electric & Power Company, Norfolk, Va., has placed ten new buses in operation in the Virginia seaside city, according to a recent announcement from the company's headquarters in Richmond. The new equipment is of the same type as that put in operation in Richmond in January.

Public Service Transportation Company, Newark, N. J., bus operating subsidiary of the Public Service Railway, accepted delivery on sixteen Mack 29-passenger city type buses, six-cylinder motor, 233-in. wheelbase. These are a part of the original order for 147 buses.

Iowa Southern Utilities Company, Centerville, Iowa, has received from the Allentown factory of the International Motor Company two city type Mack four-cylinder buses, 25-passenger capacity.

Pittsburgh Motor Coach Company, Pittsburgh, Pa., has bought six Yellow buses. These are type X, 17-passenger parlor cars.

Milwaukee Electric Railway & Light Company, Milwaukee, Wis., has purchased three Yellow buses. Two of these are 29-passenger city type and the third is a parlor car.

Wisconsin Public Service Company, Madison, Wis., has purchased four 21-passenger street car type Yellows.

Consolidation of Street Railway Journal and Electric Railway Review

Published by McGraw-Hill Publishing Company, Inc.

CHARLES GORDON, *Editor*

Volume 69 New York, Saturday, June 18, 1927 *Number* 25

Use of Another's Idea Is a Mark of Ability

STRANGELY enough, among electric railway maintenance men there is a curious antipathy toward utilizing a method or device which has been developed on another property. Just what the cause of this feeling may be it is difficult to determine, but that it exists is common knowledge. Manufacturers' representatives who follow closely the maintenance practices of various properties are particularly conscious of the reluctance among maintenance men to admit the merits of the other man's ideas.

Even when visiting other properties with the expressed purpose of getting new ideas, there seems to be, somehow, a negative attitude. Each man tends to defend his own methods. He is inclined to shut his mind against what the other fellow is doing, instead of seeking actively anything good which he can apply.

No one man or group of men can hope to develop the best methods of handling the multiplicity of routine maintenance jobs that are encountered on a railway. Free interchange of experience and diligent search for new and better ways of doing an old job are safeguards against out-of-date methods. Use of other people's ideas is not a reflection on the ingenuity of the man who tries to apply on his property every idea which will increase efficiency, regardless of its source. It is quite the contrary as a measure of a man's ability as a maintenance executive. It is an indication of alertness, and if diligently followed out ultimately gives his property the benefit of the entire industry's cumulative experience.

Housing Type Axle Bearing Keeps Bearings Tight and Gives Longer Life

DEVELOPMENT of a housing type of axle bearing such as that used by Third Avenue Railway, New York City, and described in the May 21 issue, is of outstanding importance. The necessity for using a split type of axle bearing and a motor frame projection with an axle cap has made the operations of machining and clamping of axle bearings to keep the axle parallel with the armature shaft and to provide minimum clearances a trying problem. As the easiest solution, motor maintainers have been inclined to use loose axle bearing fits. These have proved dangerous to gears and pinions. Manufacturers of gearing have called attention repeatedly to the disastrous effects of spread gear and pinion centers in railway motors and to the decreased life that results when axles and armature shafts are out of parallel. They have a right to expect that gears and pinions will be operated with a minimum clearance for motor bearings so as to decrease the pounding and increase the mileage that results when gearing is kept in proper mesh.

The use of a housing type of axle bearing should permit these bearings to be operated with the small clearances found possible with armature bearings. The wedge key arrangement for holding the bearing should keep it tight in its housing and so do away with excessive wear at that point. By using a chuck of the same construction as the axle bearing housing for boring the bearing an accurate fit should result and parallelism between the armature shaft and axle be maintained.

The improved type of construction is also of advantage in keeping dirt and water from entering the bearings. These are two destructive agents that produce excessive wear.

How Can Definite Limits of Wear for Motor Fits Be Established?

MUCH helpful information on desirable limits of wear to assist in maintaining true gear-center distance for railway motors is given in the two articles by P. A. Pontius, the second of which is published in this issue of ELECTRIC RAILWAY JOURNAL. In a modern railway motor, he points out, there are ten places at which wear causes spreading of gear centers. The wear in service at these ten points differs widely and so the repairs to bring the fits back to the desired machining allowances come at different periods. At one overhauling perhaps only one of the ten surfaces has reached the limit of wear set as the condemning point. The others are worn but have not been worn to the limit. If they are allowed to go without repairs until the next overhauling they may be worn far beyond the maximum desired. When, then, should repairs be made? This is the complicated problem that must be solved by the maintenance forces.

As an aid in deciding how much a motor fit may be worn before repairs should be made, the author gives maximum limits for wear at each of the ten surfaces and recommends that each railway property keep records of the wear for these different points during the standard overhauling period. With such a record, limits can be established at which repairs must be made and the department head can be sure that the motor will run without danger until another overhauling period.

This is but one part of the investigation that is needed. The overhauling period used may not be so adjusted that it will come at a time when most parts require repair or scrapping. Accurate records of wear will help to determine this correct period.

This is the issue in June that is devoted essentially to maintenance and construction subjects

Proper maintenance of these motor parts should not end with repair or replacement, but an attempt should be made to improve the parts that have the shortest life so that they will last a multiple of the longest overhauling period. In the first article, desirable limits of wear were established; in the second, maximum machining allowances for proper repairs are given. Operators may use these as a basis for careful investigation of their service conditions with a view toward establishment of definite limits of wear based on recorded experience.

Take a Leaf from Canada's Notebook!

PROBLEMS of electric railways are not in any essential respect different in Canada from what they are in the United States, although with the severe winter conditions they are, if anything, more difficult. This was quite evident to any one who attended the Winnipeg convention this month. It is significant that the Canadian operators are giving fully as much thought to the developments of the day as are those on this side of the border. One of the topics which came in for a lively discussion was the treadle door. Railways large and small are finding that it makes practicable the use of one-man cars in many situations where it formerly has been considered necessary to continue two-man equipment.

Another significant discussion centered on the safety of various types of cars. Without exception it was the experience that the one-man car is safer than the two-man car. Not only do the safety devices which are incorporated in the modern one-man car make certain types of accidents impossible, but the centering of responsibility on the one operator eliminates confusion and the opportunity of blaming another for one's shortcomings.

The comments of the Canadian railway men carry the more weight in that the methods used by them have proved successful, if one can judge by the results. The survey of the properties throughout the Dominion made by the Canadian Electric Railway Association and published in ELECTRIC RAILWAY JOURNAL for May 14 indicates that during the past year business has increased on all but two of the roads that reported their results. Surely this is a record which indicates that the work of furthering modernization of plant and of methods carried on by the industry in Canada over the past several years is bearing fruit.

Simplification as a Means of Reducing Maintenance Costs

FOR some years Secretary Hoover's Division of Simplified Practice has been urging the elimination of unusual or unnecessary sizes and forms of products as a means of reducing waste and increasing the general efficiency of American manufacturing methods. Ray M. Hudson, chief of the division, has recently pointed out that manufacturers faced with the problem of steadily declining price levels can reduce production costs through elimination of the less popular sizes and varieties, with resultant saving in both production and distribution. It has been definitely proved, he says, that diversification adds both to production and to selling costs. While this has been surmised by all students of the problem for years, it is significant that Mr. Hudson has gone to the trouble of obtaining definite proof for it.

The same arguments that apply to manufacturing processes hold equally well for the railway in maintaining its plant. A diversification of equipment or of track construction can lead only to the multiplication of processes of repair, with resultant higher costs. Many of the most prosperous companies have but one or two standards of track and a like number of standards for cars. Perhaps it may be argued that a more judicious choice would be better for some particular route or piece of track. Be that as it may, the necessity of having diverse methods of maintenance fitted for the various types of construction will more than likely outweigh the advantages.

Even with old equipment it is possible to go far in the simplification of parts. As they wear out fittings of various sorts may be replaced with the company's standard. Motors or trucks of odd types may be retired to make way for others that are standard on the property.

Savings made in this way are of several kinds. Reduction of stock means that a lower inventory can be carried, and orders can be made larger, so that better prices and deliveries can be obtained. Repairs can be made more quickly and more accurately, as workmen are able to become more familiar with the limited number of processes developed for repairs. When the repaired cars go into service the chance of failure is lessened as the work is better done due to the concentration of effort on a limited number of types. The time a car is held out for repair is less, as it is seldom necessary to wait for a part to be ordered from the factory. With all these advantages, it behooves every maintenance man to investigate fully the possibilities of this attractive field for cost reduction.

Conference Leaders to Be Trained During the Cleveland Convention

ONE American Electric Railway Association committee whose activities have given tangible results in the last two years has been that on education. Last year, following several demonstrations of how to conduct a foremen's conference presented at several sectional meetings, the committee on education presented an actual foremen's conference at work before the American Association at the last Cleveland convention. This year it is planned to carry the work still further and provide an actual school operating four hours a day from Monday until Saturday during convention week at Cleveland, to which operating companies may send representatives to train for the work of conducting foremen conferences on their properties during the coming year.

At the meeting of the committee on education, reported elsewhere in this issue, it was decided to head the instruction group by H. H. Norris, educational adviser of the Boston Elevated Railway, and A. J. Sarré, occupying a similar position in the New Orleans Public Service, Inc. Tentative plans were also developed to call in the services of Frank Cushman of the Federal Board for Vocational Education, Washington, D. C. Messrs. Norris and Sarré are well known in the industry, having had many years of public utility experience to their credit. Mr. Cushman likewise is considered one of the best exponents on the conference method of instruction of foremen in industry as a whole. This triumvirate as leaders will not only do much to instill further interest into the foremen conference method of training for leadership, but it promises to do much more, as it will provide actual instruction for such men as come to learn how to conduct such conferences.

As planned, this group will be limited to 50 delegates and open to all member companies in the industry. It is expected that delegates who register will attend each of the six four-hour sessions in the mornings of convention week. With this program completed, it is expected that the foremen conference idea will take another important step forward in the actual work that should follow during the course of the year. It is gratifying indeed that this committee's activities have had so practical a result.

Satisfaction or Your Money Back

BUSINESS institutions in America as a whole have reached a level of honesty and idealism so high that today "satisfaction or your money back" has become a common motto. A dissatisfied customer has simply to state his claim and there immediately follows an adjustment. The desire to please has been recognized as a powerful factor in holding as well as securing patronage. As the result, claim or adjustment departments are a part of every well-organized industry.

In the majority of instances dissatisfaction may be proved in a tangible way. Whether one has purchased a paper of pins or an automobile the *modus operandi* of adjustment is comparatively simple. On the other hand, there are many things bought in the day's mart in which an intangible factor of dissatisfaction plays a major rôle, *per se*, the car ride. Few relatively cheap purchases present more claims of dissatisfaction or produce a greater adjustment problem than this popular form of transportation. For example: We may carry the passenger from A Street to Z Avenue—his desired destination. In the accepted sense we have fulfilled a contract, yet perhaps have failed miserably to create that sense of satisfaction that holds business. In short, we have been so engrossed in transporting a human being for a given distance that we have forgotten that that human being considers the distance traveled as only a minor part of the "commodity" purchased. We have forgotten that he who rides thinks. He is observing our unkempt rolling stock, indifferent and discourteous employees, uncomfortable seats, poor schedules and all the other inexcusable shambles which seem to shout lustily "the public be damned." Think for a moment! What would be the department store's chance for patronage if similar conditions obtained within its walls?

In all events, if such a condition exists on any utility, regardless of whether it has sold car-miles at a ledger profit or a loss, it has piled up an intangible debit that sooner or later will engulf all material gain. What is far worse, it has constituted itself a star salesman for private transportation. If we hold this view of our duty to the public we have forgotten also that the average passenger considers it a useless task to attempt an adjustment of his reactions. While elemental logic dictates that the company has from a material standpoint given him value received, he is nevertheless utterly dissatisfied. He immediately plans some sort of redress and he easily turns to the method made so simple by the price war of the automotive industry. He even considers "Shanks' mare" in the general plan.

How Far Have We Progressed in Adjusting These Claims?

THANK goodness, communities in which so depressing a complex exists as that mentioned in the preceding editorial are rapidly approaching a minority. Every issue of the JOURNAL carries numerous articles on new and rehabilitated equipment, on courtesy and modern management that sustain such an assertion. This is encouraging, but not the whole answer. While the industry is rapidly realizing the danger and has taken giant strides in the right direction, it has yet a final step to take in investigating the car rider's psychology. This step has been boldly taken by the Pittsburgh Railways and was concretely outlined before the Canadian Electric Railway Association by W. H. Boyce, commercial manager for the company. His discourse, "Development of Miscellaneous Revenue," abstracted in last week's JOURNAL, page 1055, read:

"The director of public relations is a liaison officer in relations with the police and fire departments, county detectives and other municipal representatives. He is also the clearing house for all complaints, commendations and suggestions from the patrons of the company. Whether these come in person, by mail or by telephone, no complaint is left unsettled. In the case of complaints by mail, personal visit at the home or office of the complainant is the regular practice. In other instances, where a laborer has been hunted up at his work, the employer himself has secured a new light on the earnestness of the management."

Here is the next and concluding step which will bring the electric railway industry to its new goal—mental and physical satisfaction per car-mile sold. To reach this goal we must continually have in mind the question: How far have we progressed in adjusting the passenger's intangible claims? "Satisfaction or your money back" must be included in the industry's creed.

Avoid Confusion by Keeping Records Up to Date

WITH the passage of time styles change in names as in all other things. "Smith's Corners" adopts the dressier cognomen of "Fairlawn." The old "Turnpike" becomes "Grand Boulevard." Cars which used to run on the "Crosstown" line now carry the more imposing designation "Broadway." Although it may be doubted whether all these changes are real improvements, they are of frequent occurrence, and the new names eventually become as well known as were the old.

Records kept by the electric railways are intimately connected with the names of towns and streets where the company operates. The way department has maps showing the position of its tracks. Often the line department designates its cables and feeders according to their location. The mechanical department may classify the rolling stock by the lines on which the cars are operated. When a street name or a route is changed, records should be altered to correspond.

Needless confusion results when different departments use different names for the same thing. If the transportation department wants 100 pads of transfers for the "Broadway" line, it should not be necessary to look on the "Crosstown" shelf in the store room. This sort of thing can be avoided if careful attention is paid to keeping records up to date.

Building and Maintaining Track in Salty Sand

In paved street the Atlantic City & Shore Railroad uses rigid construction with 9-in. grooved girder rail. In open construction 5-in. tee rail is used. To prevent rail corrosion sand is kept 1 in. below the tops of the ties

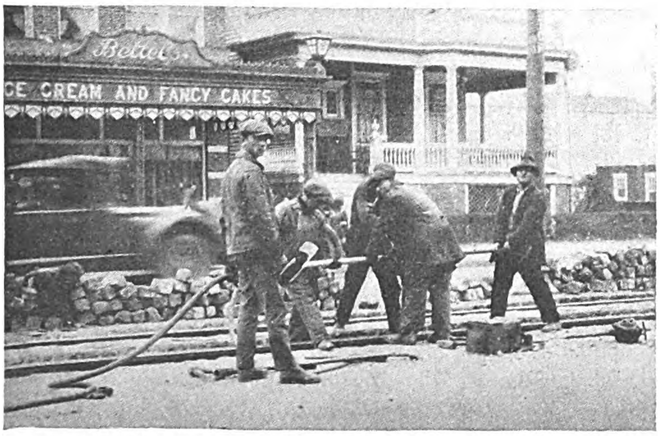
By R. I. D. Ashbridge
Chief Engineer Atlantic City & Shore Railroad, Atlantic City, N. J.

DESIGN and maintenance of track of the Atlantic City & Shore Railroad, Atlantic City, N. J., involve a number of unusual problems on account of ground conditions. The subgrade is salty sand and ground water is close to the surface. This necessitates particular precautions to prevent rail corrosion. Another element which has an important influence on the design of the track structure is the operation of steam railroad freight equipment over the same rails as the electric cars.

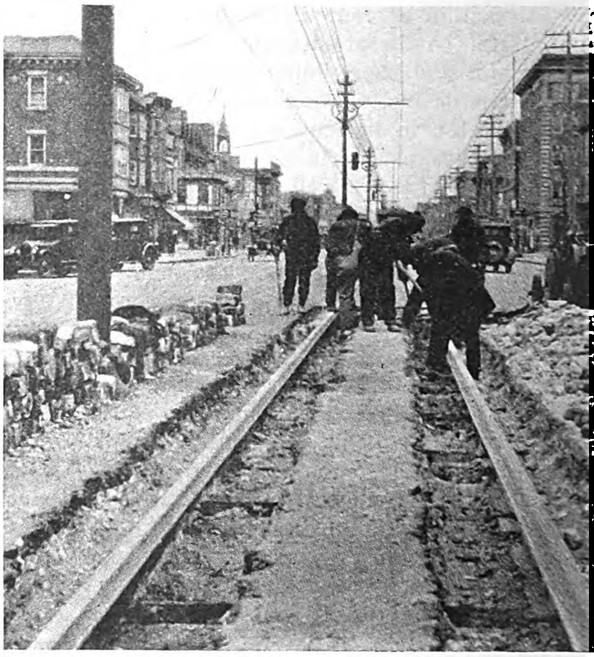
On Atlantic Avenue, the principal thoroughfare of the city, where the trunk line of the railway runs, the track is of the rigid type. Rails are 9-in., 141-lb. grooved girder Bethlehem section No. 263. They are laid with 15/32-in. tie plates on untreated long leaf yellow pine cross ties 7 in. x 9 in. x 8 ft. 6 in. Ties are spaced 2 ft. ¾ in. center to center. Under the track is a continuous 6-in. slab of concrete, with a 2-in. layer of broken stone under the ties tamped to bring the track to proper surface. The subgrade is a fine seashore sand. The ties and the lower part of the rail are incased in concrete.

The total depth of this track structure is approximately 24½ in., distributed as follows:

Rail	9 in.
Tie plate	$\frac{15}{32}$ in.
Tie	7 in.
Broken stone	2 in.
Concrete slab	6 in.
Total	24$\frac{15}{32}$ in.

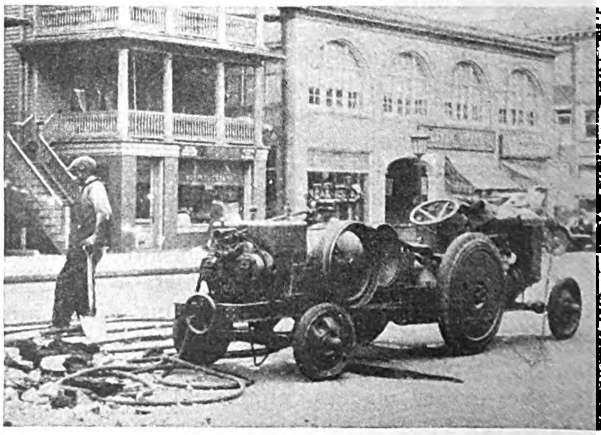


Pneumatic socket wrench is used to tighten the screw spikes used in Atlantic City



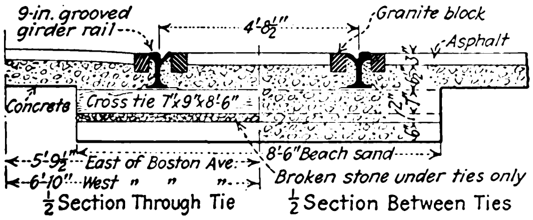
Opening up track on Atlantic Avenue preparatory to reconstruction

One row of granite block stretchers is laid along each side of each rail. A 1:2 Portland cement mixture is used as a filler between the rails and the blocks. Joints between rail and paving block are sealed with Genasco paving filler. Except for the area immediately along-

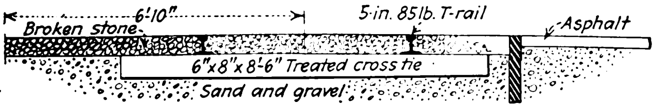


Air for pneumatic tools is obtained from a compressor mounted in rear of a Fordson tractor side the rail, where the granite blocks are laid, the paving surface is a 3-in. layer of asphalt laid on the concrete which incases the ties and the lower part of the rail. A cross-section of this track structure is shown in an accompanying drawing.

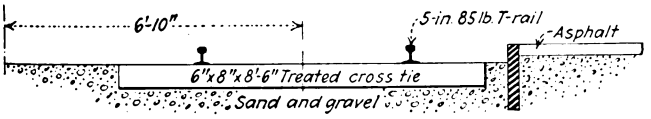
This track was built in 1906 in the manner outlined in the preceding paragraph. When it became necessary in 1924 to rebuild certain sections of the track a number of modifications were made in the design. This reconstruction work is still being carried on, as conditions require, according to the design adopted at that time.



Rigid track structure on Atlantic Avenue has a total depth of about 24½ in.



In the residential suburb of Ventnor tee rail construction is used, filled in with broken stone



In Margate and Longport the track is laid in an unpaved reserved strip in the center of the street

The process consists of opening up the pavement along both sides of the rail as far down as the tops of the ties, shimming up rails where necessary, drilling new holes in the tie plates and fastening the rails with ¾-in. screw spikes and cast-iron clips to the ties which are inclosed in concrete. Standard railroad cut spikes with chisel points formerly had been used. Trouble was experienced, however, from corrosion. In some places the base of the rail was eaten away to such an extent that the spike was no longer effective. This difficulty has been overcome by the use of the screw spike and iron clip. A pneumatic drill and auger are used to bore holes for the screw spikes and a pneumatic socket wrench to tighten them. The air supply for the pavement breaker is obtained from a compressor mounted behind a Fordson tractor and operated by the tractor engine. The drill, auger and socket wrench are operated by air from an electrically driven air compressor.

After twenty years of service the untreated pine ties on Atlantic Avenue are still in good condition. Approximately 10 per cent of the joints have become loose at one time or another, and the receiving rail become cupped. These cups have been built up by welding and grinding. During the reconstruction work where the rail ends have been found cracked by drilling or broken by the heat of welding, the joints have been cut out and 10-ft. "dutchmen" inserted. New plates have been installed where it has been thought desirable to strengthen the joints. In such instances cable bonds have been carried around the joints and buried in the concrete back-filling.

New granite block stretchers have been laid outside the rail. Old blocks which remain in good condition are laid along the inside lip of the rail. Cal is used in all concrete to hasten the setting of the cement and to prevent freezing in cold weather. As it is not possible to reroute the cars this work has had to proceed under traffic. During the summer season, from June to the middle of September, traffic is so heavy that the work has to be discontinued altogether.

On this track, where the 9-in. girder rail is used with the heavy concrete foundation, there has been a great deal of rail corrugation. This has been removed from time to time by means of rotary grinders, reciprocating grinders and grinding blocks attached to the underside of a car by heavy springs.

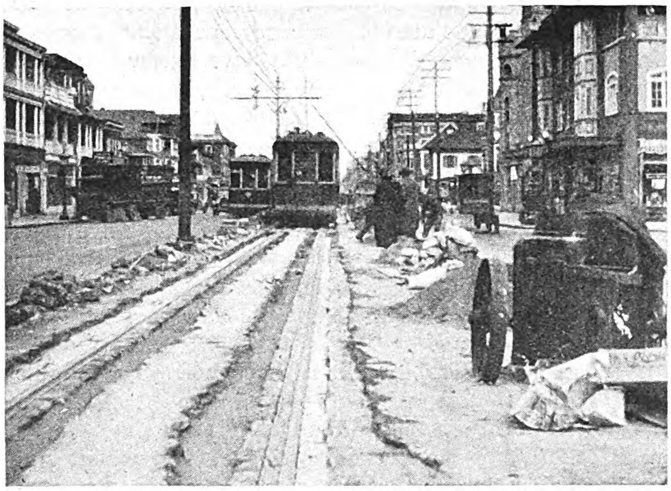
TEE RAIL USED IN OPEN CONSTRUCTION

In Ventnor, a residential suburb lying to the south of Atlantic City, the track structure of the Atlantic Avenue line consists of tee rail laid on treated ties. The subgrade is sand and gravel. By ordinance a layer of broken stone extending from the top of the tie to the top of the rail is required. Since the rail was laid in 1912 and this stone placed the crevices have been more or less filled with salty seashore sand carried by the wind. This has accumulated along the base of the rail and around the spike heads. A combination of vibration of the rails under traffic and arcing between rail and spike has cut away the base of the rail at the spike heads as far back as the web in some instances. For this reason the average life of the rail in this type of track is only about fifteen years, although the head remains in good condition for a much longer period.

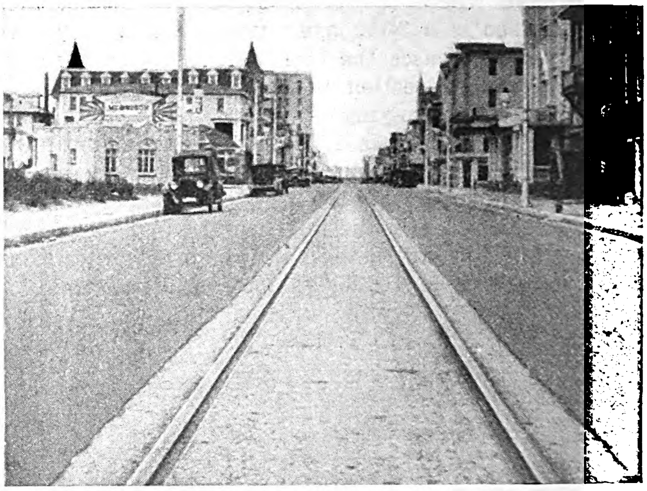
The adjoining municipalities of Margate and Longport have not insisted upon the filling of the track area with broken stone. Careful attention is given to keeping the sand about 1 in. below the tops of the ties. Track is laid practically on the beach at Longport, however, and it has been impossible to keep the base of the rail free of sand. Much trouble has been experienced from corrosion. Painting the rail with red lead has been tried in Longport, but has not proved altogether satisfactory. In spite of all precautions the life of rail averages only about sixteen years. In this atmosphere the joint plates corrode very rapidly and have to be replaced at frequent intervals, even though they are oiled from time to time.

STEEL TIES USED IN LATEST RECONSTRUCTION JOBS

During the spring of 1925 the double track on Virginia Avenue, Atlantic City, between the Boardwalk and Atlantic Avenue, was rehabilitated. This track is used by the multiple-unit interurban trains of the "Shore Fast Line." New 7-in. grooved girder rail was laid on International twin steel ties imbedded in con-



When reconstructing track in paved street, new granite block stretchers are laid outside the rail, while the old blocks are used inside

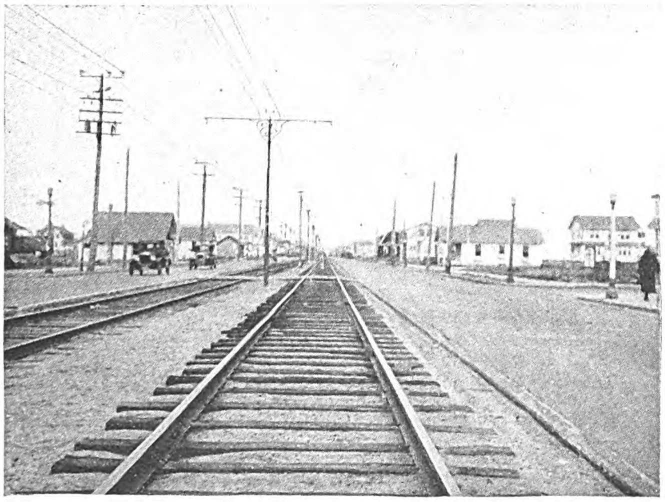


Monolithic construction with 7-in. grooved girder rail and concrete paving in the track area at Ocean City

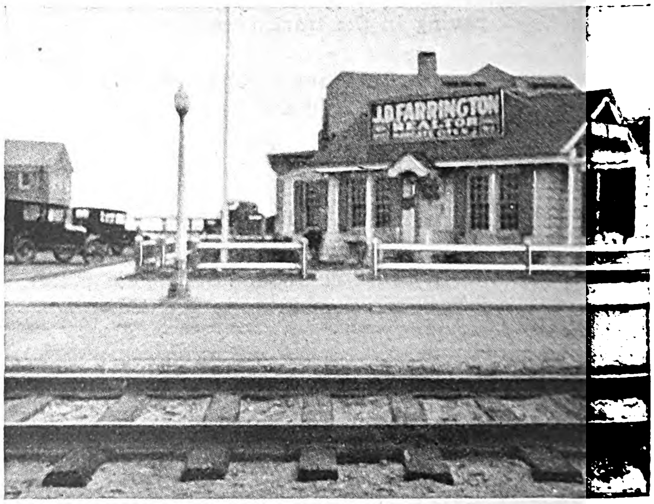
crete, in 62-ft. lengths, with the ends milled and undercut. Staggered machined joint plates 22 in. long are held in position by four heat-treated bolts as well as top and bottom seam welds. A 7-in. concrete slab was laid below the base of the rail. Granite block stretchers are used on both sides of the rails. Elsewhere the concrete extends to within 2 in. of the surface. Paving is sheet asphalt. Great care was taken in this work to ram the concrete thoroughly under the rails and the ties. The total depth of the track structure is 14 in. as shown in an accompanying drawing.

Single track on Eighth Street, Ocean City, from West Avenue to the Boardwalk, a distance of approximately 2,000 ft., was rebuilt in 1926. It had been laid in 1908 with 85-lb. A.S.C.E. rail on reinforced concrete girders, the rail being secured to cast-iron yokes with bolted clips. Due to frequent undermining for the installation of water and gas service pipes, electric conduits, etc., the track was in bad condition. Because the city desired to widen, repave and otherwise improve the street, the company consented to rebuild the track with 7-in., 128-lb. grooved girder rails. They are 66 ft. long, with ends milled and undercut. Joints have staggered 22-in. machined plates seam welded. As on Virginia Avenue, the rails are laid on International twin steel ties imbedded in concrete, which has a total depth of 14 in. In this instance, however, the street paving wearing surface in the track area is of concrete instead of asphalt. The slab was laid as a monolith, making the track structure as nearly rigid as possible. This type of track on Eighth Street, Ocean City, and on Virginia Avenue, Atlantic City, has proved very satisfactory so far. No sign of joint failure has been detected and the track is nearly noiseless.

On one of the subsidiary lines on the salt meadows between Atlantic City and the mainland, where there is not more than 6 in. of ballast between the sod and bottom of cross ties, and where the salt water from storm tides sometimes covers the track, it has been found that there is great difference in the life of the untreated cross ties used. Chestnut ties last only three or four years, while many of the short leaf pine ties have lasted 24 years, though badly cut under the rail. This is believed to be due to the absorption of salt. Untreated long leaf pine ties also have a long life in the same locality, though few have been used. Life of rails on this type of roadbed is comparatively short as the base corrodes very fast.



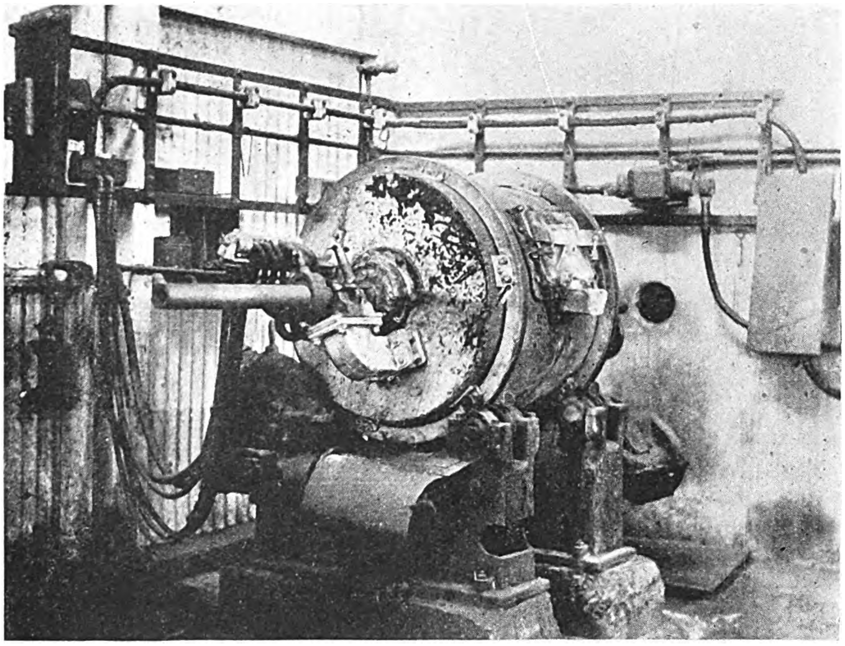
Open construction with 5-in. tee rail laid on creosoted ties is used in Margate



To prevent corrosion sand is kept at least 1 in. below the tops of the ties

Bearings Made of Lead Brass

Composition used by the Market Street Railway is said to have exceptional qualities—Reclaimed scrap totals four-fifths of the materials used in manufacture—Rapid methods used for machining cut cost without loss of accurate fits



Bearings, both axle and armature, are poured from an electric furnace.

BEARINGS, both armature and axle, are produced in the shops of the Market Street Railway at a cost which represents a saving of approximately $15,000 annually. This saving is the profit derived from operating the brass foundry, if castings were charged out at market prices such as prevail on the Pacific Coast.

Materials for the manufacture of the lead-brass bearing which is now standard on this property are, for the most part, obtained from scrap motor coils, reclaimed bearings, trolley ears, trolley wire and other parts of car and line equipment originally manufactured in the shops. Some new materials are required, but these total only about one-fifth of the amount which goes into the furnace. For the year 1926 the following quantities of scrap and new materials were used:

	Pounds
Scrap brass	77,814
Brass borings	189
Scrap copper	77,292
Scrap lead-brass (original castings)	25,907
Scrap lead-brass borings	47,144
Total (old material)	228,346
New copper	16.512
New tin	8,348
New lead	16,524
New zinc	2,113
New nickel	413
New material used	46141

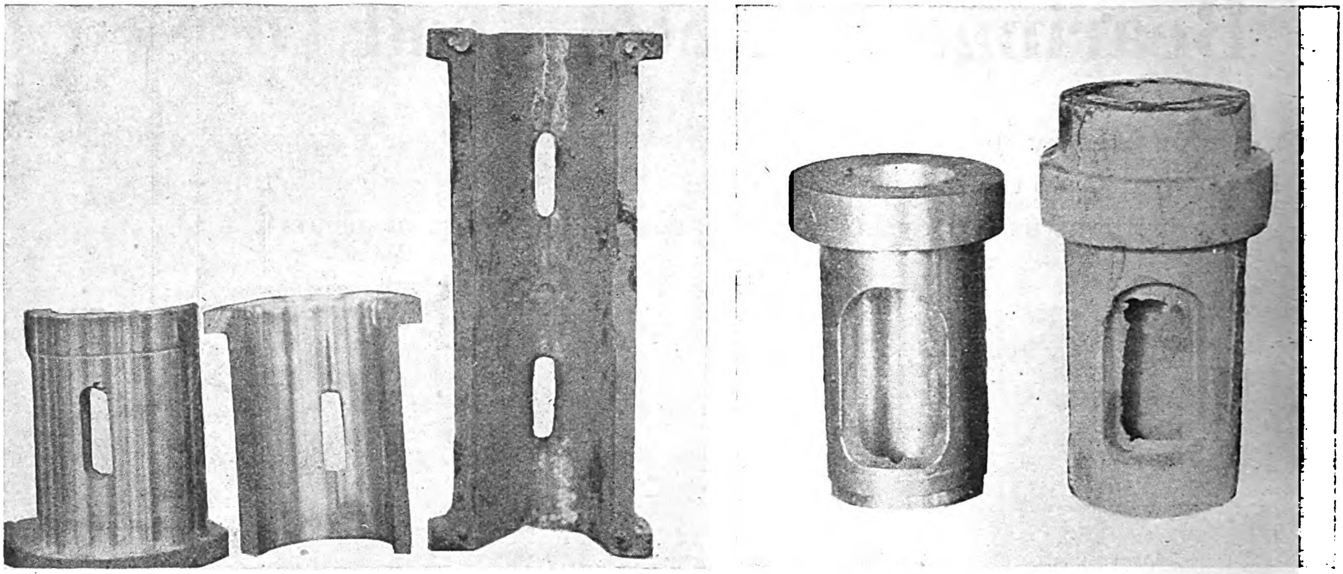
From these the following quantities of finished bearings, trolley ears and miscellaneous castings were manufactured:

	Pounds
Bearings	101,643
Trolley ears	23,671
Miscellaneous castings	50,171

Lead-brass was adopted for armature and axle bearings approximately two years ago. The replacement of the babbitt-lined bearings has been taking place since then and by the first of February, 1927, the entire equipment will be changed over from babbitt to bronze bearings. On motors equipped with the bronze bearings there has been only one armature down on the pole pieces in the past two years. This condition is a vast improvement over that which existed with the use of babbitt-lined bearings.

While manufacturing the bearings and other brass castings is on a small-quantity production scale, there is enough of this work to make it profitable. The composition of the bearings approximates closely the formula: Copper, 70 per cent; lead, 22 per cent; tin, 6 per cent. A slight variation is made for the manufacture of trolley ears and other castings requiring greater tensile strength than that needed in bearings. An electric furnace of the rotating type is used for melting the materials. This allows for a minimum of oxidation and results in a uniform pour which can be controlled accurately.

Axle liners are cast in pairs, end to end, with the flanges at opposite ends of the castings. Armature bearings are cast with an extended shoulder beyond the flange. These features facilitate the machining.



Castings for axle and armature bearings before and after finishing

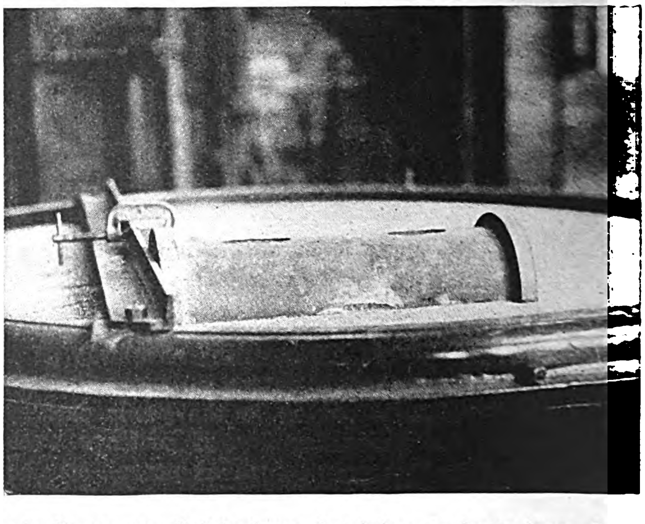
At the left, finished axle liners compared with the double castings, in which form they remain until after the outside surface is finished. The view at the right shows how armature bearings are finished both inside and outside at one operation on a turret lathe. An extension shoulder beyond the flange of the bearing serves as a means of holding the bearing in the chuck of the lathe until it is cut off at the flange after the various machining operations are completed.

Machine work on the bearings is preceded by a thorough cleaning of the castings in the sand blast room. After this the axle liners are finished off on the joint surface by a horizontal rotating emery plate. Formerly the finishing of these bearings required a planer and the services of a mechanic for approximately five days per week. Now the finishing is done in the spare time of the mechanic who operates the wheel grinding machine. Between the time required for setting up a pair of car wheels in the grinder the mechanic has opportunity to face off all of the axle lining castings needed to keep the machine shop busy with this work. A gage developed to meet the requirements of this grinding has simplified the work to a considerable extent. It is D shaped, with one end open to slip over the casting. The straight-edge is placed on the ground surfaces while the point gages up the outside of the curved casting. An allowance of $\frac{1}{16}$ in. over or under the gage is permitted.

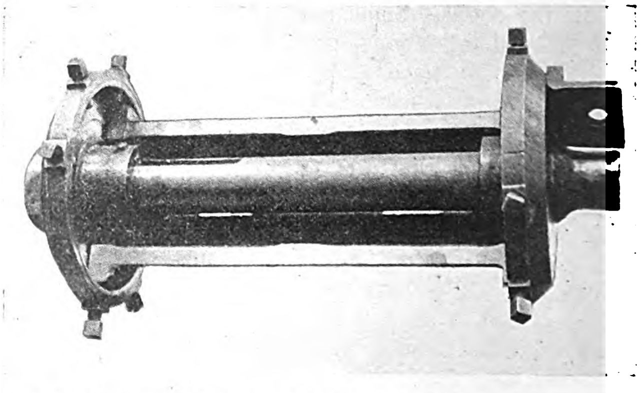
After the surfaces are ground two castings are mounted face to face in a jig provided with adjusting setscrews so that the split will come at the exact center. This aligning of the castings is important in the finishing of axle linings on this property. An illustration of this jig with only one double casting in place shows how they are lined up. With two double castings held together in this manner the outside surface is finished up to and including the inside edge of the flanges. The two castings are then cut in halves to form two pairs of axle linings which are so exactly matched that any two finished linings will match up for a complete bearing.

Pairs of axle linings with the outside finished are clamped in a taper chuck with the flanged ends out and finished ends on the inside. The outside end of the flange is also finished, the fillet being cut between the inside bore and the flanged surface. The oil grooves are cut by hand.

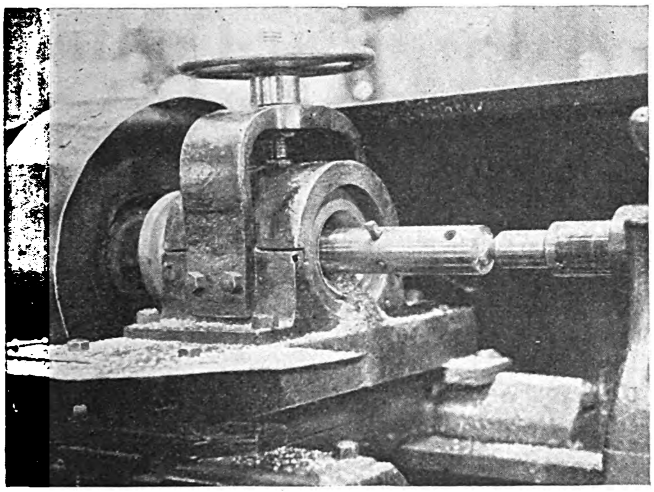
Four sizes of axle linings are made to fit into the various types of motors used. In addition, three varia-



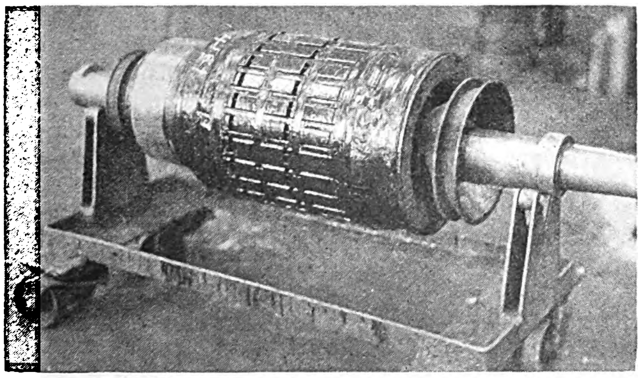
Axle liners are finished on the joint surfaces by a horizontal rotating emery wheel. The use of this wheel has saved the services of a shaper and a mechanic for five days per week



A jig holds two double axle lining castings face to face while the outside surfaces are finished. Gage lines, in the heads of the gage, center the split of the bearings so that any two halves match accurately



Final finish and fit are given the armature bearings in this fixture. A shaft clearance of 0.013 in. is allowed



Armature equipped with lead-bronze bearings used in the motors of the Market Street Railway, San Francisco

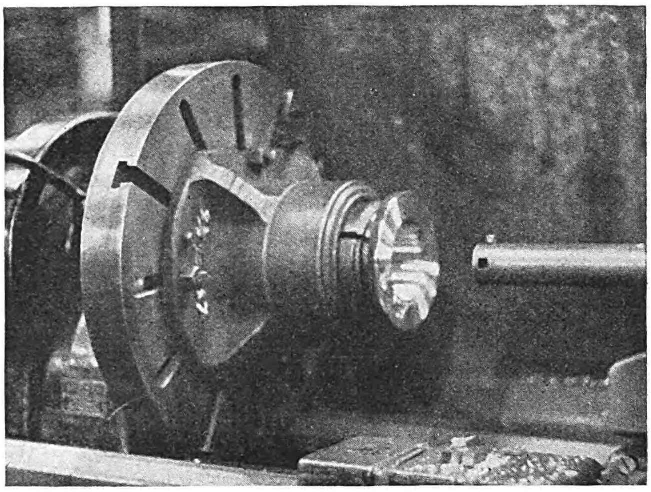
tions in inside bore of the four types are made to accommodate under-size axles. Finished axle bearings are marked in pairs and motor type number and size of axle stamped on the ends. They are placed in the storeroom to be drawn out on requisition.

Armature bearings follow a somewhat different process. The extended collar cast on the flanged end is held in the chuck of a turret lathe while the bearing is finished inside and outside in one operation.

The inside is bored the full length of the casting while the outside finish is carried up to the flange shoulder. The flange and end groove on the flange are finished, after which the bearing is cut away from the shoulder held in the chuck. Five types of armature bearings for both commutator and pinion ends are made. These are also bored in three sizes, namely $\frac{1}{8}$, $\frac{3}{16}$ and $\frac{1}{4}$ in. small. This allows for variations in armature shafts.

Final fitting of the armature bearing to the shaft is done by the armature department. The bearing is finish bored 0.013 in. larger than the shaft. Bearings are placed on the shaft and the pinion pressed on. The armature is placed on a rack pending installation.

Quantities of 100 bearings of the various types and sizes are manufactured at a time. This keeps the machines operating under what might be termed, in a small way, quantity production. It allows for economical performance and of course has been a factor in reducing the ultimate cost of the bearings.



Two halves of axle lining with the outside finished are held in taper chuck for boring on engine lathe

Transportation—A Study in Evolution

FOR several weeks in the window of the Philadelphia Rapid Transit Company's intercity motor bus terminal on South Broad Street, Philadelphia, appeared a rather unique transportation exhibit. It consisted of a series of artist's impressions of the various stages of transportation, starting with the caveman, who had to depend largely on his own legs to get over the ground, and covering progressively the chariot, the cart, the horse car and similar intervening stages until the modern gas-electric bus was evolved. The pictures were mounted on a device operated by an electric motor and which exhibited the scenes successively.

Electric lights, arranged behind the beaverboard frame of the exhibit, lighted the pictures and the cards of explanation on either side. Considerable interest was evoked by the passersby on Broad Street and while the device was in operation a large crowd was generally gathered in front of the window. The South Broad Street office is the terminal for the P.R.T. intercity bus routes to New York, Wilmington, Baltimore, Atlantic City, Trenton and Washington. De luxe, gas-electric parlor car buses are used on all of these runs and the recent exhibit was designed to show that these vehicles are the last word in safety, comfort and efficiency in public transportation.

Correct Motor Repairs Keep Gear-Center Distance Accurate*

The ten surfaces on which wear will cause spreading of gear centers should be brought back to correct dimensions at each regular motor overhauling

By P. A. Pontius

**Renewal Parts Engineer Westinghouse Electric & Manufacturing Company,
East Pittsburgh, Pa.**

WHEN a motor has been taken out of service for overhauling, the question arises in the maintenance man's mind as to how the motor parts which affect the gear-center distance can be repaired and as to the proper machining allowances. This question is answered in the present article, in which the ten surface members under consideration are the same as those mentioned in the previous article. In regard to some of the terms used in this article the following should be noted:

1. *Nominal dimension* (in inches and fractions) is the theoretical or nominal standard to which the allowances have to be added or from which all variations are made.
2. *Basic dimension* is the theoretical or standard size from which all variations are made. The basic dimensions will include the allowances for fits.
3. *Limits* are the specified maximum and minimum dimensions permissible for any part.
4. *Tolerance* is the permissible difference between the limiting dimensions.
5. *Variation* is the limited deviation above or below the basic dimension that can be tolerated.
6. *Allowance* is the prescribed difference between the dimensions of mating parts to provide for various classes of fits.

Example: A bearing is to be pressed into a housing. The nominal dimension for both the outside diameter of the bearing and the housing bore should be 4¼ in. The dimensions should be specified on drawings as follows:

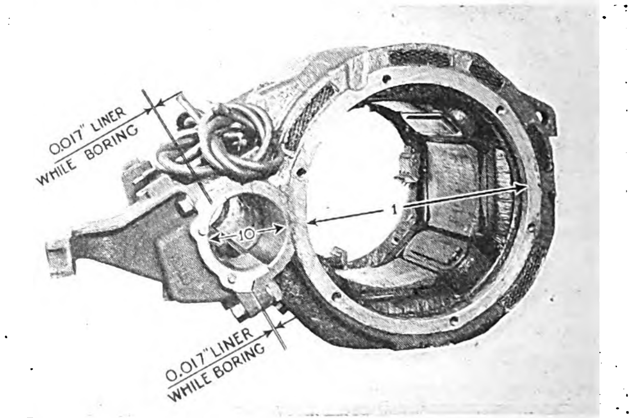
Outside diameter of bearing, 4.254 in. $\left\{\begin{matrix}4.254\\4.252\end{matrix}\right.$

Bore of housing, 4.249 in. $\left\{\begin{matrix}4.249\\4.251\end{matrix}\right.$

Nominal dimension, 4¼ in.
Basic dimension of bearing is 4.254 in.
Basic dimension of housing is 4.249 in.
Limiting dimensions of the bearing, 4.254 in. and 4,252 in.
Limiting dimensions of the housing, 4.249 in. and 4.251 in.
Tolerance of bearing is 4.254 in. minus 4.252 in. = 0.002 in.
Tolerance of housing is 4.251 in. minus 4.249 in. = 0.002 in.
Variations of bearings are 0 — 0.002 in.
Variations of housing are 0 — 0.002 in.

If the wear of the housing seat in the steel motor frame has progressed so far that a new or repaired housing will not fit tightly, the frame should be welded by adding new material and the housing fit should be bored to the same dimensions as on the new motor or, without welding, the frame should be rebored to a diameter larger than standard. However, before doing this the quality and thickness of the material surrounding the housing seat in the frame should be determined to make certain that the casting will have sufficient strength after reboring. Worn bolt holes and dowel holes in the frame should be welded and drilled.

In specifying allowances for the housing fit in the frame it is necessary to distinguish between box frame and split frame motors. The calipered dimension of the standard or oversize diameter of the housing seat in box frame motors should be within the limits of plus 0.00 in. to minus 0.002 in. of the nominal dimension. The necessary clamp fit in the housing seat of the split frame motor is obtained by placing single 0.017-in. liners at the split of the frame halves during machining and removing them afterward. With these liners in place the housing seat should be bored to standard or oversize diameter within the limits of plus or minus 0.001 in. of the nominal dimension. These allowances and variations should also be used for the bearing seat in the split frame motor without housings.



Housing and axle bearing seats in box frame motor

Worn housings which do not fit tightly in the remachined frame housing seat can be welded with little if any trouble except on housings of malleable iron. Sufficient material should be added by welding to finish the outside diameter on the housing to standard size or larger, depending on the bore of the housing seat in the frame with which it is to be used. Worn bolt holes, dowel holes or key seats in the housing should be filled by welding and remachined. Housings made from malleable iron or other materials can be repaired by shrinking on a steel ring. The housing has to be machined for the proper seating of the ring and the ring must be finished after it is shrunk on in place, the same as for the welded housings. If neither of these two methods is applicable, a new housing with standard or oversize frame fits is necessary. A worn oversize housing can be machined to standard size and used in a new, repaired or unworn frame housing seat.

---

*This is the second of two articles on proper allowances and repairs to keep gear-center distance of railway motors accurate. In the first article, published in the issue of ELECTRIC RAILWAY JOURNAL for May 21, motors in service were considered and limits were given for wear.

The allowance for the frame fit on the housing is different for the various materials used in the housing and depends mainly on the strength and elastic limit of the material. The nature of the surface finish and size of contact area of the surfaces fitted together should also be considered. The allowances which will be given for different outside diameters are for malleable iron housings. The character of the surface finish is assumed to be the same as on new motor parts, i.e., a good average finish. The necessary allowances for a tight fit are as follows, considering the conditions outlined above:

	Nominal Diameter
(A) For housings used in box frames:	
Up to 7 in. diameter	+0.002 in. +0.004 in.
Above 7 in. to 21 in. diameter	+0.003 in. +0.005 in.
Above 14 in. to 21 in. diameter	+0.004 in. +0.006 in.
Above 21 in. to 28 in. diameter	+0.005 in. +0.007 in.
Above 28 in. to 35 in. diameter	+0.006 in. +0.008 in.
Above 35 in. to 42 in. diameter	+0.007 in. +0.009 in.
(B) For housings used in split frames:	—0.000 in. +0.005 in.

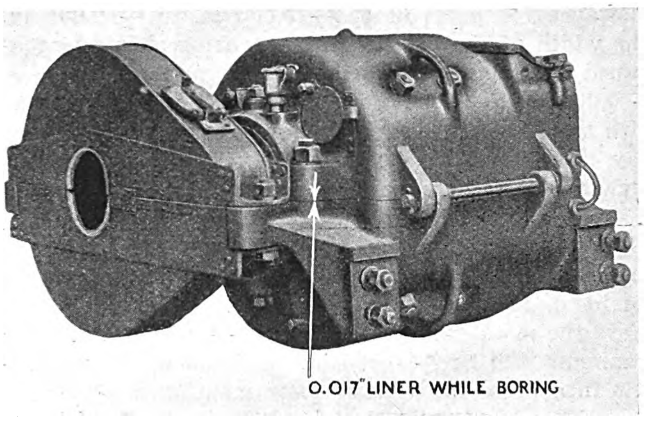
The above allowances are suitable for malleable iron. A smaller allowance is required for cast-iron housings, for a smoother finish and for a wider contact surface. Cast-steel housings, rougher finish or a narrower contact surface may require more allowance for press fit in box frame motors.

The following minimum and maximum allowances for malleable iron housings in box frame motors may be obtained:

	Minimum	Maximum
Up to 7 in. diameter	0.002 in.	0.006 in.
Above 7 in. to 14 in. diameter	0.003 in.	0.007 in.
Above 14 in. to 21 in. diameter	0.004 in.	0.008 in.
Above 21 in. to 28 in. diameter	0.005 in.	0.009 in.
Above 28 in. to 35 in. diameter	0.006 in.	0.010 in.
Above 35 in. to 42 in. diameter	0.007 in.	0.011 in.

A small chamfer on the housing and frame will assist the assembly of the housing with the frame.

Bolts holding the upper and lower halves of frame together provide the necessary clamp fit of the housing in a split frame motor. A gap of 0.016 in. minimum and 0.023 in. maximum between the two halves of the frame gives sufficient clearance that the clamping bolts can exert the necessary pressure on the housings at the frame seat.

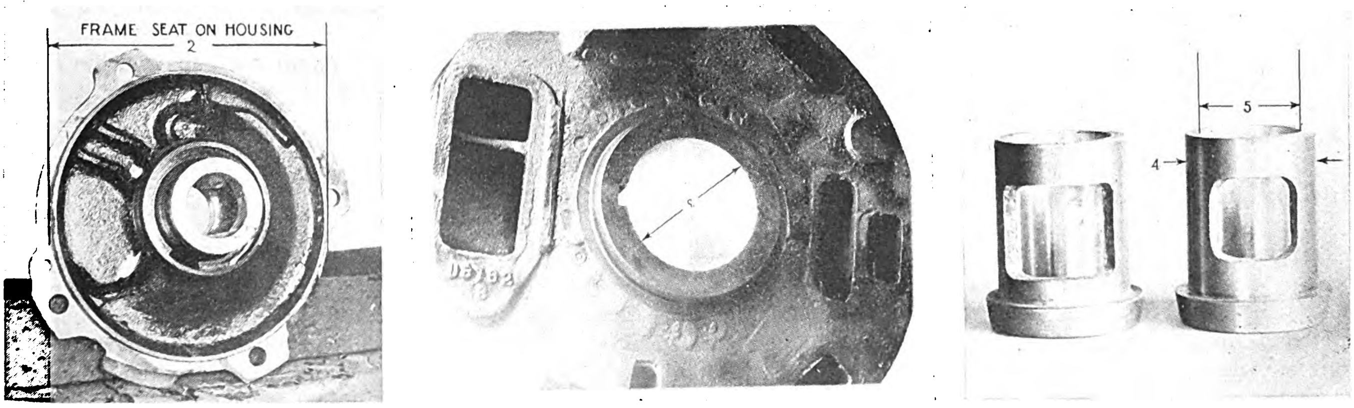


Housing fit in split frame railway motor

If a new bearing with standard outside diameter can be forced into a housing with a pressure less than 1 ton, the housing should be rebored to a diameter larger than standard and the keyway cut deeper. Housings with weak bearing seats should be scrapped if a safe press fit of approximately 5 to 8 tons is not needed to hold the bearing in place and new housings substituted.

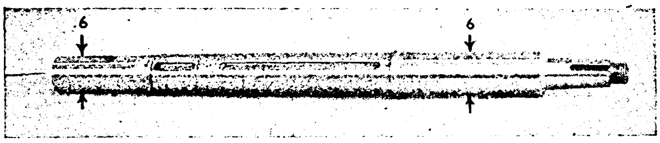
In boring the housing for the bearing seat no allowance should be made. The standard or oversize bore should be machined to a diameter within the limits of ± 0.001 in. of the nominal dimension. The variations for the keyway in the bearing seat in the housings are — 0.000 in. to + $\frac{1}{64}$ in. above the nominal dimension for depth and — 0.000 in. to + 0.003 in. above the nominal dimension for width.

In order to obtain a good press fit of the bronze bearing in the housing with a pressure of approximately 3 to 5 tons, it is essential that the bearing be not removed from its seat unless it must be repaired or the armature end play adjusted. A bearing should not be returned to service if the pressure required to press it into the housing is less than 1 ton. Bearings with standard outside diameter which cannot be held in place in a new or repaired housing with at least 1 ton pressure should be scrapped and new bearings used instead. Bearings with oversize outside diameter should be machined to standard size if when forced into a rebored housing less than 1 ton pressure is needed. The new armature bearing should be finished on the outside to the nominal standard or oversize dimensions plus an

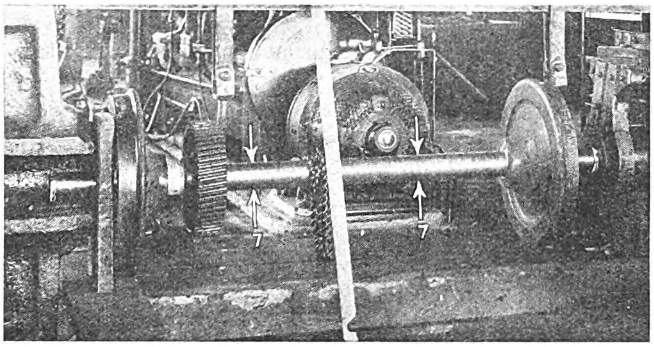


At left, frame seat on a housing. In center, armature bearing seat in housing. At right, armature bearing outside fit and bore. Bearing at right is an improved design of that shown at left in which the size and shape of the oil opening is changed to increase the press fit allowance for press fit of + 0.003 in. to + 0.005 in. The width of the keyway in the bearing should be machined to nominal dimension within the limits of + 0.000 in. to — 0.002 in. in order to have a tight fit with the key. The variation for the depth of the keyway is — 0.000 in. to + $\frac{1}{64}$ in. The length of the keyway in armature bearings should be within the limits of — 0.000 in. and + $\frac{1}{16}$ in.

Considering the variation on the finished bore of the housing and the allowance and variation on the finished outside diameter of the bearing, the minimum allowance above the metal-to-metal fit will be + 0.001 in. and the maximum will be + 0.005 in. This allowance will result in a press fit, as previously mentioned, of 3 to 5 tons, depending on the design of the bearing, thickness of bearing shell and size of oil opening. Bearings placed in split frame motors without housings are clamped in their seats by means of the bolts holding the frame halves together.



Shaft with armature bearing seats indicated



Axle with motor axle bearing seats indicated

As long as the bearing can be held in place with at least 1 ton pressure all the wear in the bore and on the face of the flange can be repaired by rebabbitting. The babbitt lining can be made thicker and bored to fit the standard or undersize shaft, providing the thickness of babbitt is less than the single air gap between armature and pole piece. An important advantage is incorporated in a bronze bearing shell when the thickness of the babbitt lining is smaller than the single air gap of the motor. In such bearings the shaft will run freely on the bronze shell if the babbitt melts and the armature core will not go down far enough to touch the pole pieces. This will enable the motorman to bring the car to the carhouse without holding up the traffic. If the babbitt melts when the lining is equal to or larger than the single air gap, the armature banding wire, the armature insulation, coils or even fans and other parts may be destroyed and the wheels locked.

The babbitt lining should be $\frac{1}{16}$ in. thick in new bearings with standard bore, as well as in bearings with undersize bores for use with worn shafts machined smaller than standard, as $\frac{1}{16}$ in. is the recommended limit of wear in a bearing bore if worn on one side. Operators with a few motors of one type may use new bearings with linings $\frac{1}{8}$ in. thick if it is desirable to rebore the bearings for each individual worn shaft.

Excessive wear on the flange end can be compensated for by taking the bearing out of the housing and placing steel rings, each $\frac{1}{16}$ in. thick, behind the flange so as to bring the total armature end play within allowable limits, which should be not less than $\frac{1}{32}$ in. Babbitted bronze bearings should be bored with the following allowances and variations:

Nominal Bore	Allowances and Variations Before Pressing the Bearing Into the Housing
2 in. to 3 in. inclusive	+0.006 in. to +0.008 in.
Over 3 in. to 4 in. inclusive	+0.008 in. to +0.010 in.
Over 4 in. to 5 in. inclusive	+0.012 in. to +0.014 in.

Bearings should be finished on the thickness of the flange within the limits of plus or minus 0.005 in.

The repair on the bearing seat of the armature shaft goes hand in hand with the set-up made for the machining of the bearing bore. Operators with many motors have standardized on shaft sizes in steps of $\frac{1}{32}$ in. or $\frac{1}{16}$ in. diameter less than the original. They carry bearings in stock having finished bores in the same gradations. In such cases the shaft should be machined to the next smaller standard undersize diameter if it is worn $\frac{1}{64}$ in. maximum on the diameter. This subject was discussed in an article, "The Use of Undersize and Oversize Armature and Axle Bearings," published in ELECTRIC RAILWAY JOURNAL, issue of April 18, 1925.

In modern commutating pole motors the bearing seat of the armature shaft should not be weakened more than $\frac{1}{8}$ in. on the diameter. Even this margin has to be decreased for special light-weight motors or for shafts not made from the necessary high-grade material. Bending or breakage of the shaft causes trouble which is more expensive to repair than to supply a new shaft. Worn shafts machined down to the safe limit may still be used with a steel sleeve shrunk over the full length of its bearing seat. This steel sleeving can be machined to the standard diameter if it still possesses enough mechanical strength to be held tightly in place.

Operators with only a few motors of the same type should preferably true up the tapered worn shaft and bore the respective bearings to suit the new diameter. A steel sleeve could be shrunk on the shaft and the same procedure followed as that recommended when the shaft is worn to the safe limits. If it is worn beyond the safe limit the shaft should be replaced.

All standard and standardized undersize shafts should be machined to the nominal diameter, being finished at the bearing seat within the limits of + 0.000 to — 0.002 in. Using these limits, together with the allowances and variations on the bearing bores, the following minimum and maximum total clearance between the shaft and bearing bore will result for repaired motors, assuming that the bearing does not collapse when pressed into the housing.

Nominal Shaft Size	Clearance Minimum Maximum
2 in. to 3 in. inclusive	0.006 in. to 0.010 in.
Over 3 in. to 4 in. inclusive	0.008 in. to 0.012 in.
Over 4 in. to 5 in. inclusive	0.012 in. to 0.016 in.

These clearances are also suitable for bearings bored to suit the worn shaft. The clearances are necessary to prevent collapse of the bearing when pressed into the housing and to compensate for some of the misalignment in the assembled motor. The housing fit in the frame and the bearing fit in the housing should be checked with care to insure that these parts are seated properly if the bearing pinches the shaft. The shaft dimensions should also be checked and it should not be allowed to be bent over a reasonable amount. Finally the clearance between bearing bore and armature shaft should be such that it turns freely in the bearing and establishes the necessary oil film.

Most axles must be replaced before they reach the point where the motor bearing seat would have to be machined as far down as $\frac{1}{4}$ in. smaller than standard, which is an average safe limit. Each individual case should be considered carefully as much depends on this particular part of the car equipment. Human lives are directly endangered and considerable damage may be involved if an axle should break on a car moving even at low speed.

The axle should be machined at the motor bearing seat to the next smaller standard undersize if the diameter is worn $\frac{1}{32}$ in. maximum. This holds good only when it has been decided to carry in stock undersized axle bearings with bores in steps of $\frac{1}{16}$ in. Otherwise the axle may have its tapered worn bearing seat trued up if other repairs make it possible to do this machining at reasonable expense.

The standard or standard undersize axle should have the motor bearing seat machined to the nominal diameter, being finished within the limits of + 0.002 in. and — 0.002 in.

The wear on the axle bearing bore or on the flange end can be repaired by babbitting the bronze bearing. Excessive motor end play on the axle should be compensated for by the adjustable axle collar. The width of the flange may be increased or material may be added to the wheel hub by welding or other means to bring the end play of the larger motors within the allowable limits. The motor end play should be not less than $\frac{1}{32}$ in.

The standard bores and standard undersize bores of solid bronze or bronze babbitt lined axle bearings should be finished to the following allowance and variations:

Nominal Bore	Allowance and Variations
Bore up to and including 5 in.	+0.015 in. to +0.017 in.
Over 5 in.	+0.028 in. to +0.030 in.

The width of the bearing flange is to be finished within the limit of ± 0.005 in.

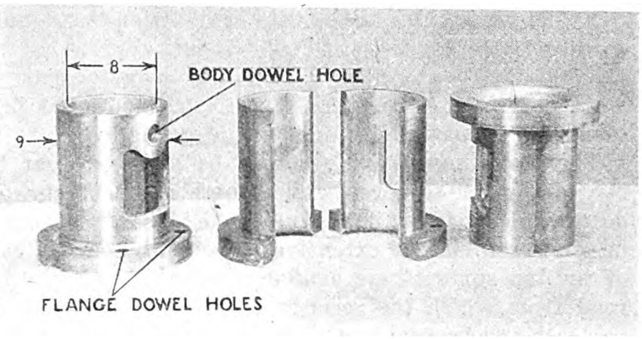
Considering these allowances and variations and the limits for finishing the axle on the motor bearing seat the following clearances between axle and bearing bore may be obtained:

Nominal Bore	Clearance
Bores up to and including 5 in.	0.013 in. to 0.019 in.
Over 5 in.	0.026 in. to 0.032 in.

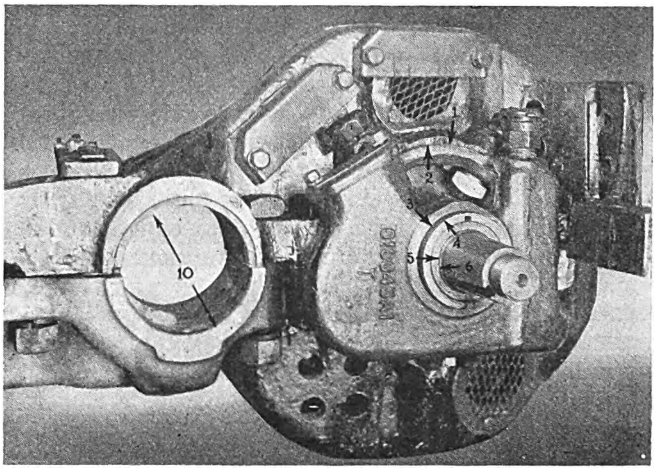
Clearances larger than those specified above should not be allowed. The clearances given cause the bearings to be clamped tightly by the axle caps of new motors, will not pinch the axle and will permit a sufficient oil film to build up around the axle in the motor bearings.

An axle bearing with standard outside diameter should be scrapped if worn on the outside to such an extent that it cannot be clamped tightly onto a new or repaired axle bearing seat. Repairs on the outside of axle bearings do not warrant the expense. An axle bearing with oversize outside diameter may be machined to standard and used on other motors if it cannot be clamped in the rebored bearing seat. Worn dowel holes or keyway of bearings should be welded up and redrilled or remachined. The allowance for clamp fit on the outside is — 0.000 in. to + 0.003 in. above the nominal diameter. Welded dowel holes in the flange should be drilled $\frac{1}{64}$ in. larger, the body dowel on the flange end $\frac{1}{16}$ in. and the body dowel on the end opposite the flange $\frac{1}{32}$ in. larger than the respective dowel pins protruding into them. The limits for the keyway in the axle bearings are the same as for armature bearings except that the width of the keyway is to be machined within the limits of + 0.002 in. to + 0.005 in.

A worn axle bearing seat in the frame and axle cap should be welded. With sufficient material added, the bearing seat can be rebored to standard dimension the same as on the new motor. The original good clamp fit of an axle bearing can also be restored if sufficient material will surround the bearing by increasing the diameter of the bearing seat in the frame and axle cap $\frac{1}{8}$ in., using a $\frac{1}{8}$-in. oversize bearing. The worn bolt holes, dowel seats or keyways in the axle cap have to be welded up and drilled or cut new.



Outside and bore of axle bearings



Complete motor with wearing surfaces affecting the gear center indicated. Oil sealed housing is used on this motor to improve lubrication

When boring the frame and axle cap a single liner 0.017 in. thick is to be inserted in the split. Then the bearing seat should be machined to the nominal diameter within the limits of ± 0.002 in. Limits for the keyway in the axle caps are the same as those for the keyway on armature bearings. The key should fit tight in the axle cap.

With the liners removed from the split after reboring, the minimum gap provided for the necessary clamp fit with the axle cap bolts will be 0.015 in. and the maximum will be 0.019 in., considering the variations on the bore for bearing seat as well as the allowance on the outside diameter of the bearing. The above gap will leave sufficient space for correct adjustment of the clamp fit on new motors. Shims may be used to release the clamping action until the bearing is properly seated. With the different motor parts repaired and machined they will fit together the same as on new motors if the surfaces are machined smooth and gaged accurately.

In the foregoing discussion the repairs on the motor to provide correct gear-center distance have been considered. The subject has been treated as if the ten surfaces had reached simultaneously the limits described in the article in ELECTRIC RAILWAY JOURNAL, issue of May 21, or as if it had been necessary to repair all parts of a motor simultaneously.

It would be ideal if the repairs of all motor parts could be made after a set time, say 100,000 car-miles. However, as this very seldom happens, operators will ask the question: "How much may a motor part be worn before repair is necessary if the motor has been taken out of service for one reason or another?"

The motor may have reached the limit of wear for one of the ten surfaces while others are not yet worn down to the condemning limits. The above question can be answered only if extensive records of wear on each of the ten surfaces are available and then only for the road from which the records are taken. Generally all parts should be repaired which will reach the set limit of wear before the motor is again due for general overhauling.

It is, therefore, recommended that the necessary set-up be made for a record for the amount of wear of the different surfaces in one overhauling period. This period should be established after giving consideration to the wear on all details of the car equipment. Records should be kept of the wear of motor parts, control equipment, braking equipment, trucks, wheels and car body. For all of these parts, limits or a definite life should be set first. The general overhauling should be made so that it meets with the time at which the most parts demand repair or scrapping.

Parts which need repair previous to the set time should be improved in quality so they can wait until the car is overhauled. Parts which have a longer life should either be improved or reduced in quality until they last a multiple of the overhauling period. Considering the ten surfaces to wear on the motor the operator can assist the manufacturer to improve motors in service and to design new motors. All motor parts would have to be considered, such as the commutator wear, brush-holder wear, fatigue of armature leads, the wear on field coils, gear, pinion, gear case and other parts subjected to wear.

The wear on the different motor parts in a given time will depend to a large extent on the kind of attention the motor will receive. The wear in the bearing, for example, will be less with better lubrication and with better oil. The wear will depend also on the sand condition of the road and the protection given the bearings against admission of sand, water or other foreign substances. The commutator, brush-holder and carbon wear depend also on the protection against sand. All these factors are different for various roads and motor designs. The amount of wear can, therefore, be obtained only by experience.

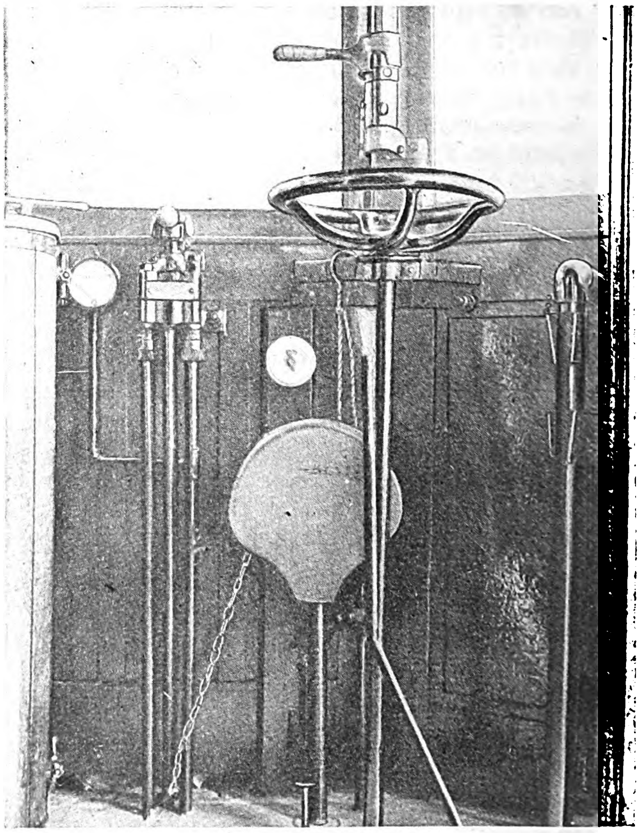
Protection adapted to special conditions can make the life of the motor parts fairly uniform for the different roads. Dust cap brush-holders, for example, will lessen wear on carbons, brush-holders and commutators, especially on sandy roads. New type dual ventilation likewise reduces this wear. Deep oil well covers and oil sealed housing will prevent admission of foreign substances into the bearings.

Records will show the weak parts and perhaps suggest a remedy. As soon as some sources of failure are eliminated more attention can be paid to the remainder. The number of failures will reach the minimum. All parts will then wear so that they require repair at the same time. The whole car and its equipment can be stripped down, cleaned and repaired at one time, thus reducing considerably the cost of maintenance. All parts will be brought up to previous standard and the equipment of today will be the same as at the time when it was new.

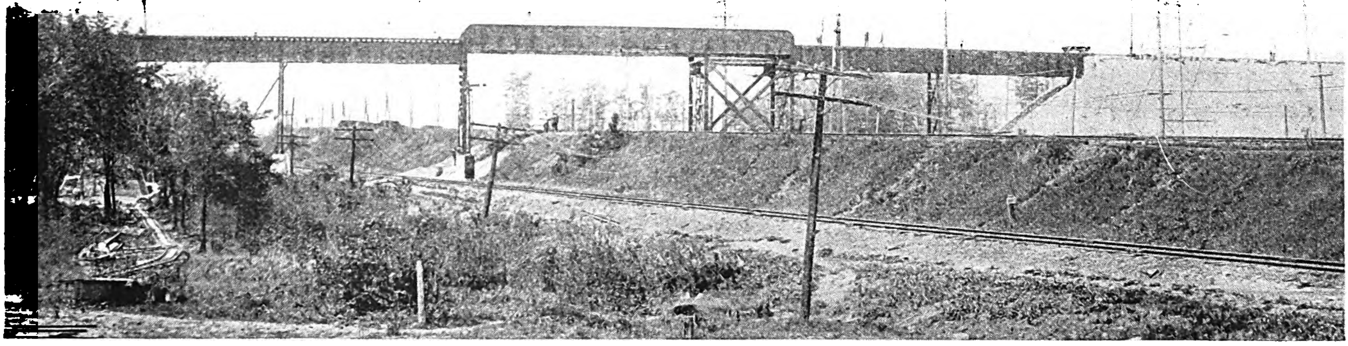
This program requires a careful study of all parts for two years or longer. Such a combined effort by all operators will bring the electric railways ahead of the steam roads and the nation ahead economically.

Motorman's Stool Chained to Platform

ON A NUMBER of double-end cars of the Connecticut Company two motormen's stools are provided, one at each end. These are fastened by chains to the floor, in such a manner that when not in use they can be set in a receptacle out of the way. This arrangement permits free movement of the stool to any desired position on the platform but prevents its removal from the car. Replacement of stools has been eliminated by this device and every motorman is sure of finding one on any car to which he may be assigned.



On this car of the Connecticut Company a stool is provided at each end for the motorman and fastened by a chain to the platform floor



An embankment 40 ft. high was required to get sufficient clearance under the steel bridge that carries the new cut-off from West Junction over the Chicago & Northwestern Railway tracks

Milwaukee Completes Important Rapid Transit Link

Twenty-three minutes running time to be saved between terminals on Burlington-East Troy line by the new cut-off

COMPLETION of a new cut-off 6,500 ft. long between West Junction on the Waukesha-Oconomowoc-Watertown line and the intersection of 93d and National Avenues on the Burlington-East Troy line of the Milwaukee Electric Railway & Light Company is the final step in the construction of a system of rapid transit entrances to the city for that company's interurban lines from the west and southwest.

Trains on the Watertown line have been operating for a year over the rapid transit private right-of-way that extends from West Junction to 36th Street on a solid embankment fill entirely free of grade crossings except between Hawley Road and 68th Street, where a right-of-way had been acquired and grade separation work will be under way this summer. Completion of the new link from West Junction to the East Troy-Burlington line will permit high-speed trains on these two divisions to be brought into the downtown terminal over the same route as those from Watertown. This will eliminate running along the congested National Avenue highway and busy West Milwaukee and West Allis Streets and effects a saving of 23 minutes running time from the former schedule.

Although only a mile long, the new link includes a wide range of construction work. Starting south from West Junction it ascends on a 3 per cent grade on a heavy fill which reaches a height of 40 ft. At this point it crosses the Wells-West Allis line of T. M. E. R. & L. Co. and the Sparta division and Madison division of the Chicago & Northwestern Railway on a steel viaduct 283 ft. long. A clearance height over the railroad of 22½ ft. is maintained. Here the track is carried over a piece of swampy land on a timber trestle 418 ft. long. The grade descends at 2.633 per cent and enters a cut approximately 1,100 ft. from the south end of the viaduct. This cut then extends for 1,900 ft., the track

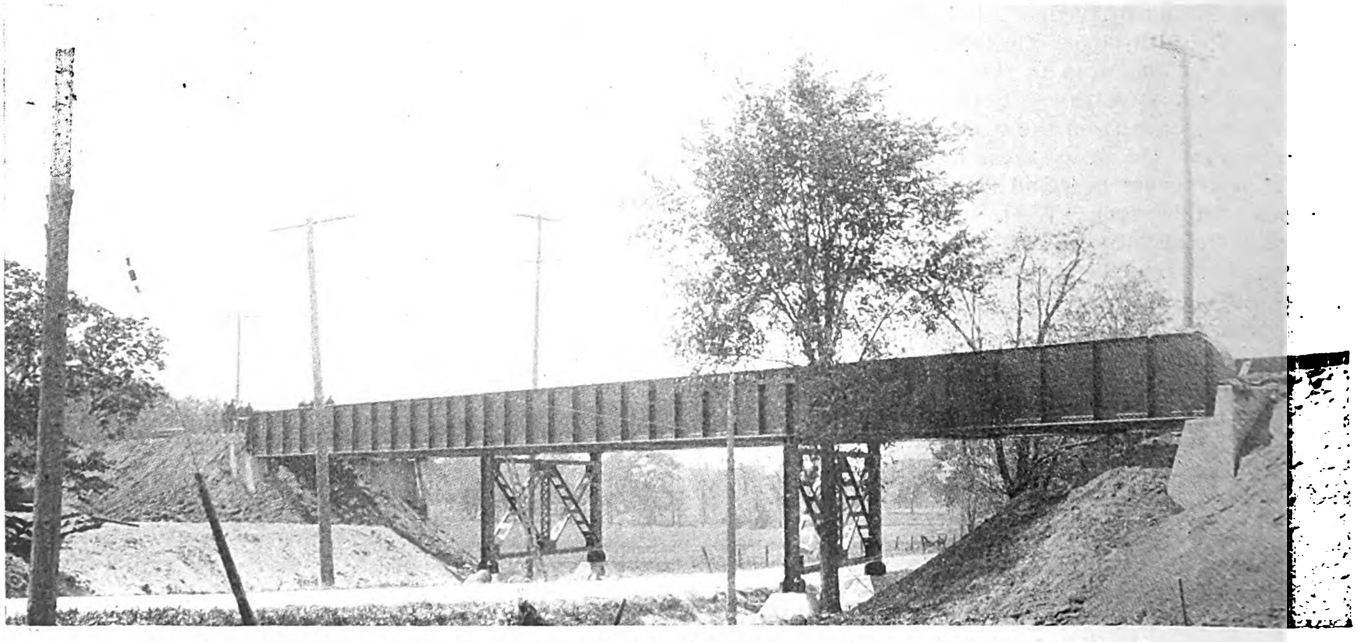
The new connection is a strategic link between the rapid transit entrance to the city and the East Troy-Burlington interurban line. A saving of 23 minutes in running time is thus made possible

passing under a steel highway bridge at Lincoln Avenue, then emerges on a fill and rises on a 1.55 per cent grade to another steel bridge over National Avenue and drops down on a 1.552 per cent grade to join the present Burlington-East Troy line tracks at grade. A total of 135,000 yd. of earth was moved in the grading and approximately 400 tons of steel went into the bridges. The bridges and cuts are wide enough for double track, although the cut-off will be operated single track until additional construction is justified. Eighty pound A.S.C.E. rail on Sellers tie plates is carried on 8-ft. cedar ties and ballasted with crushed rock from the company's quarry on the Milwaukee Northern line. Construction was started on March 3 of this year and the new cut-off is expected to be open for regular service on June 20. The line is to be fully protected by a Nachod signal system.

Trolley voltage on the Burlington-East Troy line is being changed from 1,200 to 600 volts, in line with the company's standard on the remainder of its interurban system. Five automatic substations are being installed at Mukwonago, Chamberlain, St. Martins, Wind Lake and Waterford. St. Martins is a two-unit station, the others being single. A new 26,400-volt transmission line was erected between St. Martins and Mukwonago, a distance of 15 miles. The substation buildings are of simple but neat appearance as shown in an accompanying illustration.

Chicago Rapid Transit Insures 5,683 Employees

EMPLOYEES of the Chicago Rapid Transit Company, Chicago, Ill., are insured to the extent of $10,595,000 with a maximum protection of $20,445,000 under a group plan put into effect in December, 1926. Each of the 5,683 employees is furnished with double accidental death insurance in the sum of $1,000, while health and accident insurance providing compensation as high as $20 a week for 26 weeks has been provided for any one disability in any one year.



A steel bridge over the highway at Fruitland is at the southern end of the new cut-off

You Can't Sell Cotton Goods in a Silk Age[*]

By Charles Gordon

Editor *Electric Railway Journal*

NOW, of course, you are not in the business of selling cotton goods. You are supposed to be in the business of selling transportation. And so, this subject would have been more specific if it had said, "you can't sell uncomfortable seats in clumsy, unattractive, lumbering cars in this age of air-cushioned upholstery, stream lines and pneumatic tires."

But I like the expression, "You can't sell cotton goods in a silk age." It isn't original with me. It was used by a prominent railway executive who is given to doing unusual things and using unusual expressions. This phrase is used merely as a figure of speech, but it puts into a few words a colorful summary of what I consider the best thinking on the present electric railway situation.

The industry is talking a great deal today about merchandising transportation. That is a nice sounding phrase. We are all using it. But our industry has a tendency to use such expressions as this without thoroughly realizing their significance. I doubt if there are many railway men who do not feel that they are taking every reasonable step to merchandise their service. And yet, I venture to suggest that most of the industry isn't even scratching the surface of the possibilities in this direction.

Stop trying to screw your service down to the limitations of a split penny fare. Give your riders a taste of really modern transportation and all the politicians in town can't keep you from getting the proper fare to support it.

Take this merchandising idea and hang onto it for a moment. Stop using the words merely as a trite, smooth-sounding phrase. Let's dig into this thing a little bit and see where it leads and what it demands.

Are Trained as Operators

If we are trying to sell cotton goods in a silk age we are poor merchants. The first principle of merchandising success is to provide a product that the customer will buy. If electric railway men have erred here it is not surprising. They were not raised as merchants. Their training is that of operators. In the past we have been manufacturers of the product known as public transportation. Our experience was obtained in days when the customer had no choice but to use our service. And so our entire attention was devoted to providing that service as economically and as efficiently as possible.

As transportation operators, electric railway men don't need to take off their hats to anybody. They have provided local transportation under conditions that almost defy arithmetic and make two and two equal five.

When the cost of labor and material was doubling, when the prices of all products that the industry buys were advancing by leaps and bounds, when every element that goes into the cost of local transportation acted as though it was hitched to the end of a skyrocket, the rate of fare remained practically constant for years and then slowly rose to a figure which is now only a ridiculously small amount above that before the war.

This was, however, by no means the limit of the electric railway man's accomplishments as an operator. The industry's credit went to pieces. Still he had to carry on—and he did carry on in a manner to his everlasting glory. Without money for improvements, with an unfriendly public, and with his own employees inclined to kick him when he was down, with his back against the wall, the electric railway operator managed to carry on.

I am impatient with a recital of the industry's burdens and troubles. I give you this brief review of the conditions encountered by most of the properties in this country merely to illustrate some of the operating difficulties that have been successfully overcome. I haven't given you a list of all the difficulties. It took strong hearts to carry on. The situation looked, many times, to be impossible of solution. The industry seemed doomed. It isn't surprising that some weakened and doubted. During the very period when all these troubles were piling up, the greatest single menace of all to the public transportation industry was gaining momentum by leaps and bounds. The automobile entered the picture. The country took to rubber tires. Then the sages began freely predicting that the end of the local transportation industry had come. First in the hands of its owners, then as a jitney, and finally in the form of a bus, the automotive unit on rubber tires threatened for a time to take away the patronage—and did take a lot of it—from the income-restricted, expense-ridden local transportation companies.

But they carried on. They had an obligation to their communities and one to their investors. They continued in the face of overwhelming odds to operate as best they could. They trimmed expenses, and then trimmed again. Even when L. F. Loree, president of the Delaware & Hudson Railroad, was saying that the country could wipe off its books the $6,000,000,000 invested in the electric railway industry, that industry was already turning the corner toward improvement!

Oh, yes! As transportation operators electric railway men are entitled to the admiration of the business world. They have continued to produce a ride for little increase in price when every element entering into the cost of that ride has increased enormously.

---

[*] Address delivered before annual meeting of the Mid-West Electric Railway Association, St. Louis, June 9-11.

I didn't start out here to pat electric railway men on the back and tell them how good they are. Some of them know me better than that and know that I am prone to criticise. But I hope that my criticism is friendly criticism—that is what I always intend it to be. Friendly criticism, constructive criticism, is good for any of us. I'll try not to disappoint you in that direction before I finish. But I want to get this picture of the industry balanced. I want to add another word or two on the credit side of the ledger.

Even while you were staggering under discouraging burdens—and some of you are still doing so—the measures that were introduced for economy and the improvement of service were blocked nearly every step of the way by short-sighted politicians and selfish labor. When the transportation ship was in imminent danger of foundering under the unbalanced relation between income and expense, the one-man car was conceived. This was merely a step in the direction which has brought America the industrial supremacy of the world. Mechanical safety devices were introduced to do the work formerly done by human mind and muscle. Machine labor was substituted for hand labor and the resulting economies made it possible to furnish more service at less cost than formerly.

You can't merchandise an inferior product — if you expect to stay in business in one town very long. Your product consists of your cars and the manner in which they are operated. After all, that's all you have to sell.

But in many places the improvement was bitterly opposed. Men thought their jobs were in jeopardy. Despite the fact that it was repeatedly demonstrated that the natural turnover of labor takes care of the reduced manpower required as one-man cars are introduced, they were doggedly opposed and are still being opposed in some places. I know of no city in which the introduction of one-man cars threw men out of work. But I know many cities where it brought them increased pay. I know also that it helped to save many an electric railway job, for without the one-man car many properties that are now rendering efficient service to their communities would have found it impossible to survive.

And so I repeat that as transportation operators you have justifiable cause for pride. In the face of all these difficulties and obstacles you have in large measure—most of you—lived up to high ideals of public service and have provided transportation to the millions with a full sense of your responsibilities.

MEETS A NEW CHALLENGE

Here the industry meets a new challenge. This public of which we speak so much has changed. Its habits have changed. Its demands have changed. Particularly is this true as regards transportation. Speed, convenience, comfort, luxury! That is what today's public wants, and there are 20,000,000 automobiles in the country to prove it!

"The automobile is expensive," you say. Yes, that is true, but there have been 20,000,000 of them sold in this country and nobody has found the saturation point yet. What is the significance of this? Doesn't it give the key to your merchandising situation? Doesn't it mean that the first principle of selling to the American public—or to any public, for that matter—is to make the product fit the demand? Price is a consideration, but it is a secondary, rather than a primary, one. Of course, there have been more Fords sold than there have been Packards. I'll venture the guess, however, that there are many more low-priced car owners straining their resources and sacrificing other comforts and even necessities to operate their machines than there are larger car owners in that situation. Consequently the small cars are a luxury for a large part of those who buy them. I could continue to go on in this strain. I could point to the percentage of automobiles that are sold "on time" as an indication of the financial strain which people are willing to endure in order to have speed and luxury in travel.

Please do not misunderstand me. I am not deprecating the automobile a particle. I don't think the country is going to the everlasting bow-wows because people have taken to spending their incomes on rubber and gasoline instead of other things that might have been worse. If you are tempted in that direction please remember that the savings bank deposits in this country have been built up to an astounding level. Right here it may also be worth adding that there seems to be a significant relation between this fact and the fact that the savings banks have taken to merchandising their own service intensively.

The automobile has contributed much to this country, and I am not one of those who have any idea that it should be legislated out of business or taxed to death because it carries passengers who formerly rode on street cars. In fact, the automobile has enormously increased the riding habit of the people of this country. I am inclined to believe that once we learn how to bring our service up to the level of the popular demand and at the same time learn how to merchandise it intensively, the automobile, through this increased riding habit which it has produced and through the fact that it has brought us up on our toes because of the very necessity of self-preservation, will have proved a blessing in disguise to our industry.

Rapid increase in the number of automobiles in cities will lead to great curtailment of the individual's unrestricted right to use the streets. When the number of individuals who want to use the streets becomes such that they automatically interfere with each other's rights and cut down the usefulness of the existing street facilities, then the rights of the individual must give way to the needs of the community. The right to use the streets for pleasure must give way to the uses of business and necessity. I don't believe the street car has any greater right to the use of the streets than have I in my automobile, except that it serves the needs of 75 per cent of the people, while I serve only my own convenience. As the agency for transporting 75 per cent of the people who use the streets, the public vehicle, in the name of its riders, is certainly entitled to a proportionate consideration in the regulation of street traffic. Only in the interests of its riders does it claim and is it entitled to special consideration.

Public officials are prone to be confused between the number of vehicles and the number of riders using the streets. Since the car rider is largely inarticulate and unorganized the responsibility for protecting his interests rests on the railway management. Courageous discharge of that responsibility is a public service of the highest order.

Now let's get back to merchandising. Those 20,000,000 automobiles that I mentioned a moment ago illustrate what can be done in merchandising a product which fits the public demand, even when the price of the product is a severe strain on the family purse. As transportation men, we know all about operation—that is to say, we know all about manufacturing the product—furnishing the service. But for the first time in the local transportation industry a new element has come into the situation—the need for selling the service that we formerly provided free of competition. For the first time in their experience transportation men are faced with the problems of merchandising and here their experience is very limited.

The problem is complicated by the fact that transportation men must not only take to selling their service for the first time, but the character of the demand in transportation has changed. This is indeed a silk stocking age. If there are any doubts in your mind ask the cotton mill owners of New England—or use your eyes on the street. When the shop girl will spend $2 for a pair of silk hose out of her limited income, surely price is a secondary consideration if you can make the public want a product badly enough. The industry has been concentrating on economy. It has been splitting pennies. It is only beginning to take in hand seriously the study of the quality of its product.

Of course you have been expecting me to get around to the subject of modern cars and I am not going to disappoint you. But I want to talk cars from just a slightly different angle for a moment. Permit me to repeat something that I have said several times before. Improved cars are not a panacea. They are not a substitute for good management. They do not eliminate the need for concentrated, intelligent, persistent, merchandising effort. But they are a part of good management, and they make it possible for merchandising effort to be effective. You can't merchandise an inferior product—if you expect to stay in business in one town very long. Your product consists of your cars and the manner in which they are operated. After all, that's all you have to sell.

I have been accused of advocating the "dolling up" of cars beyond the limits of practicability. I don't think it is necessary to have a lot of "gimcracks" on cars. I think many of the circus stunts are mere passing phases. They are good because they attract the attention of the public. Anything which will interest the public in the street railway situation—favorably, of course—is justified. Car improvement will ultimately settle down to perfection of design in the direction of appearance, performance and appointments, while at the same time remaining within the limits of reasonable maintenance and operating cost. There is, however, still a wide open field ahead.

MAKING RAPID PROGRESS

As we survey the electric railway situation today it is evident that the industry is moving forward very much more rapidly than some who are close to its daily routine may perhaps realize. When we consider the progress which has been made in any one of half a dozen cities that readily come to mind we are brought face to face with the complete reversal of outlook which has taken place in a very short period of time. Unless the developments are viewed in perspective the rapid change is not easily apparent. In a sense, it is like watching one's own offspring grow up. We are so close to them that they have blossomed into manhood or womanhood before we realize it.

There is no question but that the electric railway industry has definitely turned the corner and is moving forward rapidly to complete recovery and expanded usefulness. I am afraid, however, that there is still in the minds of some managements a lack of confidence in their own industry. I heard a speaker at a recent meeting, in endeavoring to illustrate the need for confidence and enthusiasm in winning success, say, "The bigger the IF on the clubhouse door, the lower the score." Spirit and confidence are as important in business as they are in sport. A little more push, a little more spirit, a little more optimism, a little more of an open mind regarding the possibilities of applying ideas developed by the other fellow, a little more enthusiasm and confidence in the possibilities of our own business are all that is needed.

President Sawyer aptly said recently: "This is a new day. The methods of the past will not suffice to meet these present-day conditions. Every precedent and practice that we have built up over these many years is subject to question." Every progressive railway man must agree with him heartily. I only add, "this is a silk age." Get the cotton goods off your shelf; make it your business to determine the kind of a product your customer wants and then sell it. Stop trying to screw your service down to the limitations of a split penny fare. Give your riders a taste of really modern transportation and then all the politicians in town can't keep you from getting the proper fare to support it.

Here the industry meets a new challenge. This public of which we speak so much has changed. Its habits have changed. Its demands have changed. Particularly is this true as regards transportation. Speed, convenience, comfort, luxury! That is what today's public wants, and there are 20,000,000 automobiles in the country to prove it!

A. TAURMAN

Wins Monthly Prize for May

Application of Alemite lubricating fittings to Brill half-ball brake hangers is awarded first $25 monthly prize in "Electric Railway Journal" Maintenance Contest. J. E. Blaiklock receives honorable mention

A. TAURMAN

AT A MEETING of the judges in ELECTRIC RAILWAY JOURNAL'S Maintenance Competition, held at the American Electric Railway Association headquarters, New York City, on June 8, it was decided to award the $25 monthly prize for May to the article describing the use of Alemite grease fittings to half-ball brake hangers. This article was submitted by A. Taurman, superintendent of equipment, way and structures Birmingham Electric Company, Birmingham, Ala.

All of the seven articles which were published in the Maintenance Data Sheet section of the May 21 issue were given careful consideration by the judges, and in addition to awarding the $25 cash prize, it was decided that the article describing a "Parawax Method for Determining Flange Wear of Wheels" should receive honorable mention for its usefulness. This article was submitted by J. E. Blaiklock, master mechanic Washington Railway & Electric Company, Washington, D. C. The use of this method takes the determination of flange wear out of the guessing class and places it upon a permanent record basis.

The practice of lubricating half-ball brake hangers through the use of Alemite fittings, as described in the May 21 issue, is an application of a method used quite universally on automotive equipment. In the original design of brake hangers excessive wear results from the difficulty of keeping them lubricated. Reduction of wear in this type of brake hanger is very important since looseness results in misalignment and reduced efficiency of the braking system. The use of the Alemite fittings by the Birmingham Electric Company has doubled the length of life of the hangers. The ease with which lubrication can be carried out after the fittings are applied insures that they are lubricated regularly. The method has resulted in a considerable decrease in the noise from trucks equipped with this type of brake hanger, and this subject is one which is receiving particular consideration by all electric railways at present.

Mr. Taurman became superintendent of equipment for the Birmingham Railway & Light Company in October, 1919. His railway experience began in the mechanical department of the Southern Railway at the Richmond shop, Richmond, Va., in 1901, where he served as machinist apprentice, shop foreman and mechanical draftsman. On leaving the Southern Railway he was connected with the American Locomotive Company as assistant resident inspector of locomotives at the Richmond Works.

In 1907 Mr. Taurman severed his connections with the American Locomotive Works to accept the position of mechanical draftsman with the New York Air Brake Company at Watertown, N. Y. In February, 1908, he returned to Richmond and entered the service of the Virginia Railway & Power Company, serving as a machinist, carhouse foreman and master mechanic. In 1913 he was promoted to superintendent of equipment in charge of all rolling stock and shops of the Virginia Railway & Power Company in Richmond, Norfolk and Petersburg.

Mr. Taurman is secretary of the Association of Equipment Men, Southern Properties, is a member of the American Society of Mechanical Engineers and has served on the equipment committee of the American Electric Railway Engineering Association. As an electric railway man Mr. Taurman has given considerable attention to mechanical improvements, not only in rolling stock but also in various track and way construction.

IN THE PAGES of the Maintenance Data Sheet Section in this issue will be found another group of articles submitted in ELECTRIC RAILWAY JOURNAL'S Maintenance Competition. One of these will receive the monthly prize of $25 for June. A considerable amount of material has been received so that space limitation prevents publication of it all at this time, but groups will appear in the issue of ELECTRIC RAILWAY JOURNAL devoted to maintenance and construction, which is the third issue published each month, and monthly prizes will be awarded as the articles are published. All material submitted has been of a very high class, and many comments have been received as to the value of the practices described. Several electric railway master mechanics have adopted them already and they should result in particular benefit to these systems and tend to the development of similar practices elsewhere. Full information regarding the rules for the contest was given in the April 16, 1927, issue of ELECTRIC RAILWAY JOURNAL, pages 700-701, and condensed rules and instructions for the contest have been published each week since.

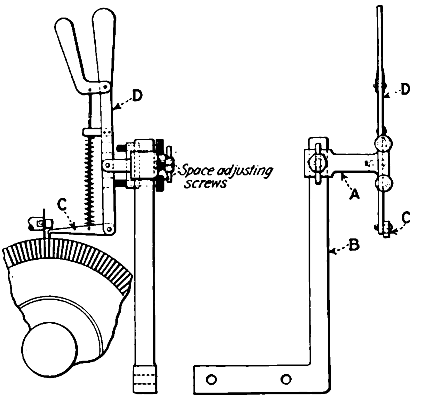
Commutator Bar Spacing Attachment for Slotting Machine*

By Charlie Herms
General Foreman San Diego Electric Railway, San Diego, Cal.

For locating commutator bars properly while under-cutting the mica, a convenient bar spacing attachment is used in the shop of the San Diego Electric Railway. It consists of an upright arm, designated as *B* in the accompanying illustration, which is bolted to the side of the slotting machine opposite the commutator. The dimensions for this arm will vary with different machines, but the upright arm should not be less than ¾ in. round stock to prevent springing.

A sliding bar, designated as *A* in the illustration, slides up or down on the upright arm *B* and holds the pawl-locking mechanism. When adjusted to the proper position, depending on the size of commutator to be slotted, the bar *A* is held in place by a locking screw. The pawl *C* should be long enough to reach to the top center of the commutator and the slot engaging point should be thin enough to enter the slot cut by the saw. It should also be low enough to pass underneath the saw spindle nut as shown in the illustration.



Commutator-bar spacing attachment for slotting machine

In our shop it is the practice to saw one or two slots by locating the bars by hand and then adjust the attachment to the proper height and pitch for the commutator. When once adjusted, the lever *D* is pulled back until it strikes the top space adjusting screw. The pawl *C* is then lifted so as to be free from the commutator and the lever is pushed forward until it strikes the bottom space adjusting screw. The adjusting screws are set so that the pawl moves but one bar and locates the next slot directly underneath the saw.

The lever must not be operated too rapidly as there is danger from the momentum of the armature tending to revolve and so pass the slot, in which the pawl is to engage. A little practice by the operator will enable him to maintain a maximum speed of operation and get the best results.

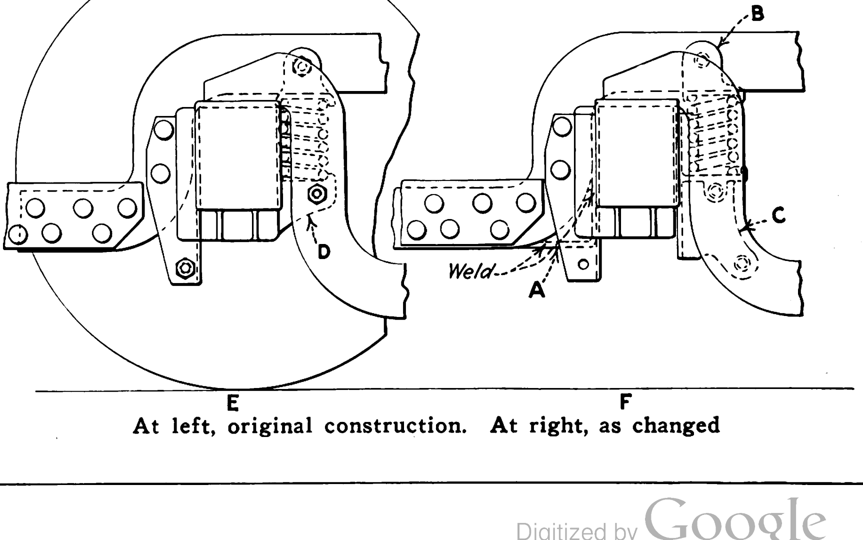
ROLLING STOCK—TRUCKS—9

Changes Reduce Truck Breakage*

By Edwin R. Clarkson
Foreman Equipment Department, United Electric Railways, Providence, R. I.

Due to excessive breakage of standard 0-50 truck frames at the point *D* shown on the accompanying drawing, changes in the method of supporting the frame on the journal box were made. A continual strain was produced at the point where breakage occurred, due to loosening of the bolts through this section. This caused wear and enlarged the holes in the equalizing bars, and the pressure of the brakeshoes against the wheels caused the bolt to act as a swivel to bring excessive pressure against the wear shim, which has no backing. The shim was held in place by two rivets. These wore through and broke.

In the accompanying illustration the sketch at the left shows the truck frame as originally constructed. The section at the right shows the changes that were made. A steel casting, *C*, bolted between the equalizing bars by finished bolts pressed into the casting was substituted for the lug of the journal box. These held the casting in the same relative position as the old lug on the box. The upper spring seat casting indicated at *B* was offset ⅞ in. to line up with the casting between bars, and a forging was welded to the side frame at *A* to provide a solid backing for the pedestal wear shim. The thickness needed was determined by measurements from the center line of the truck frame over the journal boxes allowing for the wear of the shims and for box clearance.



At left, original construction. At right, as changed

More Perfect Alignment Results from Boring Armature Bearings After Installation in Housing*

By J. A. Duffy
Superintendent of Equipment
Monongahela West Penn Public Service Company, Fairmont, W. Va.

THE method of finishing armature bearings used on our system is to finish the armature bearing on the outside, then press it into the housing and bore to the proper size for the shaft bearing fit by means of a special jig. The jig is arranged to fasten to the lathe face plate and the housing is bolted to this for the boring operation. Through the use of this practice we have obtained an increase of from 30,000 to 40,000 in the mileage of our armature bearings, particularly on the small Westinghouse 506 motors. On larger motors there has been a much larger increase in mileage obtained. The increased service results from having more perfect alignment of the bearings so that less wear results.

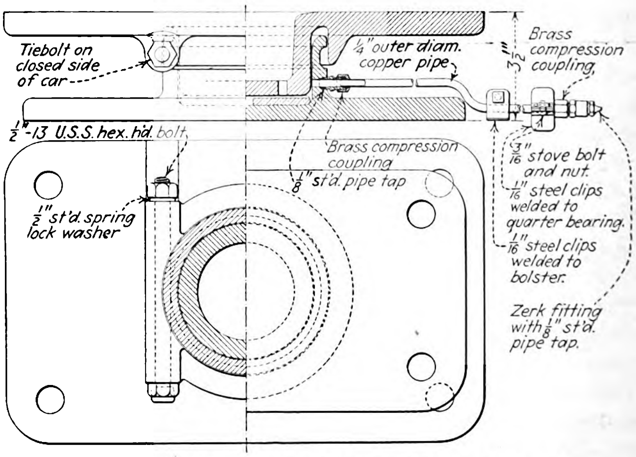
Simplifying Lubrication of Center Bearings*

By H. S. Williams
Assistant Superintendent of Equipment
Department of Street Railways, Detroit, Mich.

THE lubrication of truck center bearings has proved somewhat difficult of accomplishment due to their inaccessibility. The most common practice is to jack up one corner of the car and apply the lubricant with a gun or similar means. Often the center bearings are lubricated only when a pair of wheels are changed or some other repair is made which necessitates jacking up the car body. It is believed that in order to be effective the lubrication of these bearings must be made easy and so adapt itself to routine periodic treatment.

With this thought in mind the Department of Street Railways, Detroit, Mich., has developed a method of lubrication that is believed to meet all of the requirements of ease of operation and effectiveness. This consists in the equipment of the lower half of the center bearing with a copper tube that leads outward to the extreme end of the truck bolster. This outer end of the tube is fitted with a Zerk fitting. Consequently all that is necessary to apply the lubricant is a Zerk gun. The simplicity of the operation is obvious. In this particular design of the center bearing, a central chamber is provided with holes leading to the bearing surfaces so that any excess of grease or oil will tend to flow into this chamber and thus give the added advantage of an oil reservoir so as to retain the lubricant.



Tiebolt on closed side of car
¼" outer diam. copper pipe
3½"
Brass compression coupling
½"-13 U.S.S. hex. hd. bolt
Brass compression coupling
⅛" st'd. pipe tap
½" st'd. spring lock washer
3/16" stove bolt and nut
1/16" steel clips welded to quarter bearing
1/16" steel clips welded to bolster
Zerk fitting with ⅛" st'd. pipe tap

Method of applying Zerk fitting for lubrication of center bearing

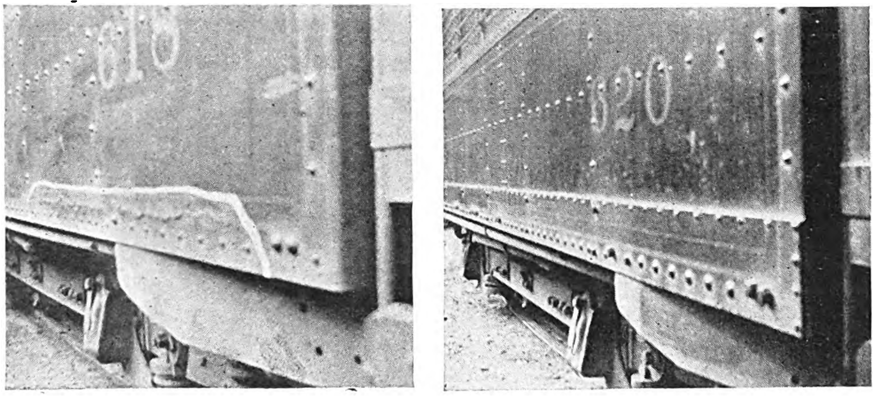
ROLLING STOCK—CAR BODY—1

Repairing Steel Side Sheets of Cars*

By R. T. Chiles
Master Mechanic Cumberland County
Power & Light Company, Portland, Me.

SOME time ago the Cumberland County Power & Light Company was confronted with the problem of repairing the side sheets of certain standard Birney cars. The side sheets were rusted through just above the top edge of the angle forming the side sill and the bottom side of the floor. The entire renewal of the side sheets would entail heavy expense and so some satisfactory method was sought which would not mar the looks of the car and still not be too expensive. It was decided to install additional steel plates running the length of the car, as shown in one of the accompanying illustrations. In practice, two different sized plates are used; one is $\frac{1}{8}$ in. by $4\frac{1}{2}$ in. wide and the other $\frac{3}{16}$ in. x 6 in. wide. The narrower plate is used where side sheets are rusted through below the bottom side of the floor. This size is less expensive to install and can be put on without removing any of the inside trim. The larger size is used where the side sheet is rusted through above the bottom side of the floor. To attach it the base boards on the inside of the car have to be removed. The method of installing these plates consists of removing rivets that hold the bottom edge of the side sheets to the angle side sill. The plate is marked off from these holes and is drilled for $\frac{3}{8}$-in. x 1-in. carriage bolts. The top edge is drilled for $\frac{1}{4}$-in. by $\frac{3}{4}$-in. stove bolts, holes being spaced on 2-in. centers.



At left, side sheet of car which has rusted through. At right, car repaired by installing a narrow plate along the bottom edge of the car

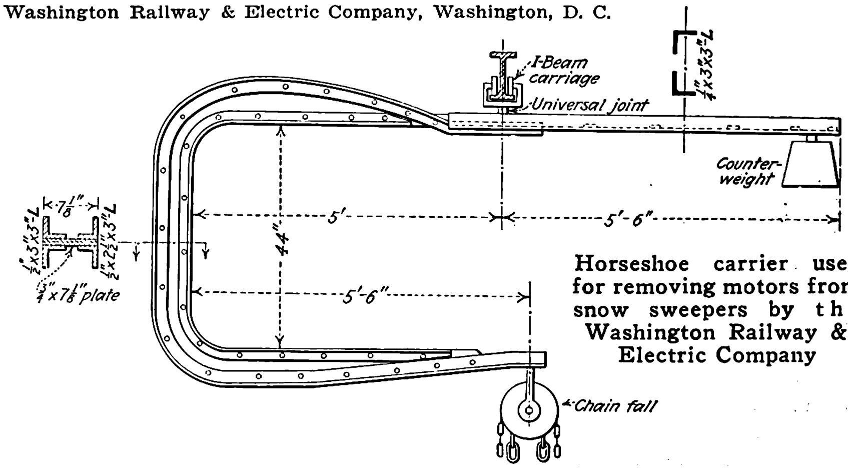
ROLLING STOCK—MISCELLANEOUS—1

Carrier for Removing Broom Motors*

By J. B. Blaiklock
Master Mechanic Washington Railway & Electric Company, Washington, D. C.

REMOVAL of broom motors from inside snow sweepers is a difficult and expensive job unless special provision is made for easy handling of the equipment. To meet this condition the Washington Railway & Electric Company, Washington D. C., in its truck shop uses a horseshoe shaped carrier beam, as shown in the accompanying sketch. This carrier is suspended on an I-beam carriage by means of a swivel joint, the I-beam running at right angles to the tracks in the shop so that the carriers can be run with the long extension over the top of the car and the short extension inside the car.



Horseshoe carrier used for removing motors from snow sweepers by the Washington Railway & Electric Company

To remove a motor after it has been loosened from its supports the lower part of the carrier has a chain hoist and the motor is lifted clear with the hoist and the whole carrier is then run out with the motor, which is then lowered to the floor.

This arrangement has proved very satisfactory and not only has saved labor but the ease and expediency of the whole operation have been invaluable in saving time, especially in connection with removal of motors from sweepers, as time is a very great essential when the equipment is needed for service. Such a carrier could also be used to advantage for handling freight in and out of box cars and for loading and unloading material from supply cars.

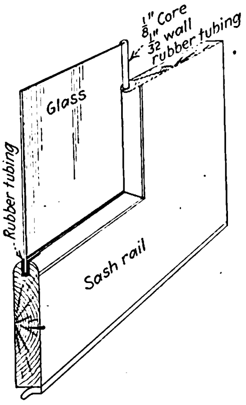
Car Glass Set in Rubber Tubing*

By Robert Harris
Master Mechanic New Brunswick Power Company,
St. John, N. B.

MUCH thought is being given to the elimination of noise on electric cars by the New Brunswick Power Company. Vibration and chatter of loose glass have been overcome through the use of rubber-cored tubing. White tubing is used, $\frac{1}{8}$ in. diameter, with $\frac{1}{32}$-in. wall. It is applied to the glass by first splitting it with a sharp pointed knife and then slipping the tube over the edge of the glass, starting in the center of any side, and bending the tubing back over the thumb with the index finger to open up the interior. Care is taken not to set the rubber too tightly lest the corners of the glass cut through. With the rubber tubing in place the glass is set in the sash and retained in place by a sash bead.



Application of rubber-cored tubing to car glass

The tubing which is used by the New Brunswick Power Company costs $1.50 per pound and there are 75 lineal feet to the pound. While this cost may appear greater than either putty or felt, the convenience of handling large quantities, the cleanliness and the reduced labor costs that result add to its advantages.

This method of installing glass has been used by our company for two years and the chatter of glass in sash has been eliminated entirely. Glass breakage has been reduced materially and the rigidness of glass has been of particular assistance in keeping out cold. It is now being applied to windows of car doors and transoms and in fact wherever glass is used in cars.

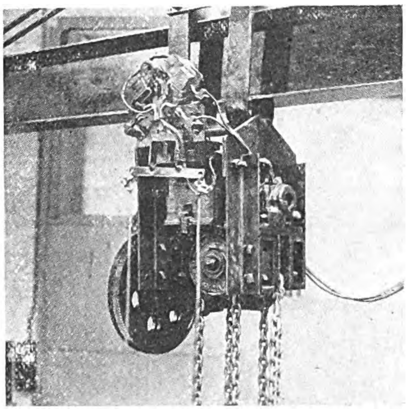
ROLLING STOCK—MISCELLANEOUS—2

Electric Hoist Made from Obsolete Air Compressor*

By Equipment Department
Georgia Power Company

AN OLD obsolete National AA1 air compressor and a chain hoist form the nucleus for an electric hoist which was built recently in the main shops of the Georgia Power Company, Atlanta, Ga. The hand chain wheel of the hoist was removed and an air compressor gear was mounted in its place. The lifting chain wheels were also removed and a piece of $\frac{1}{2}$-in. x 6-in. steel with a 3-in. hole, bored central, was placed over the axle between the body casting and the lifting chain wheels.



Type of electric hoist constructed in the shops of the Georgia Power Company

The spacing brackets are bolted to these pieces and to four legs, one at each corner, the legs being made of $\frac{1}{4}$-in. x 2-in. angles. The legs are joined at the top by separators made of $\frac{1}{4}$-in. plate through which a $1\frac{1}{4}$-in. bolt passes to fasten the hoist to the carriage which runs on top of an I-beam. The top side of each spacing bracket forms a seat for each corner of the motor portion, which is the electric portion of a National AA1 compressor. The motor portion is bolted to the brackets.

The pinion on the armature shaft engages with a second pinion, which in turn engages with the gear attached to the hoist. The second pinion was needed as the gear centers were too far apart. The idler pinion runs on a shaft fastened in the motor frame.

The starting and reversing switch is made of type R governor parts. The contact arm is mounted on a fulcrum pin set in an insulated plate and four contacts are mounted on the arm in pairs. The top contacts are connected to the trolley, the bottom contacts to one side of the fields, and the other side of the fields is connected to ground. Of the four stationary contacts the top two go to each side of the armature and the lower two connect to each side of the armature opposite from the top contacts. This provides for reversal of the armature current.

TRACK AND WAY DEPARTMENT—3

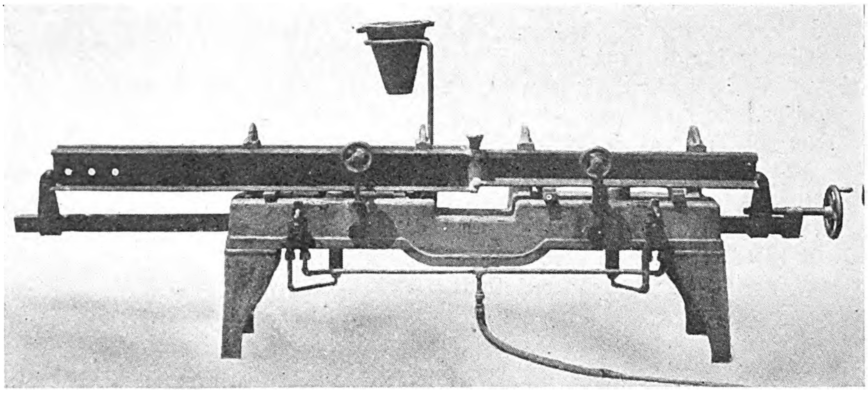
Machine Holds Rails While Welding Compromise Joints*

By A. Taurman
Superintendent of Equipment, Way and Structures, Birmingham Electric Company, Birmingham, Ala.

When the Birmingham Electric Company adopted A.E.R.E.A. 7-in. girder rail for replacing special work as it is renewed we were confronted with the problem of providing a satisfactory and economical compromise joint, to take care of connections of the two different sections of rail. In renewing special work on our lines, most of it has to be done under traffic and therefore it is impossible to weld compromise joints in the track economically.

To reduce the time and cost for setting up and welding the compromise joints a special machine was built for holding and aligning the rails while they were being welded. The machine has a cast-iron frame with four upright arms. These are planed to an accurate surface so as to align the rails. The machine is also provided with a screw clamp for pulling the rail ends together so as to secure a perfect thermit weld.

Prior to the building of this machine it required from one to 1½ hours to line up the rails and clamp them in position for welding, and then we were not always able to secure a straight joint after they were welded. With this machine but five minutes is required to put the rails in place and turn on the air in the cylinders for clamping, and the rails are held in line perfectly.



Rails in position after making a compromise joint

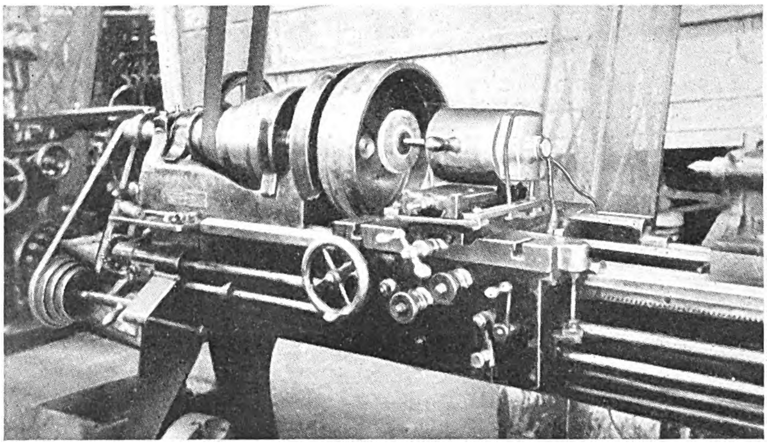
BUSES AND TRUCKS—1

Regrinding Brake Drums for Buses*

By C. H. Copley
Superintendent Springfield Traction Company, Springfield, Mo.

Both internal and external brake drums can be reground satisfactorily by a very simple method. This not only keeps the drums from the scrap heap, and so decreases the number of new ones that must be bought, but it also decreases maintenance expense due to the lessened wear on the brake linings which results from the smooth surface.

The method used in our shop is to put the drum in a lathe and true it up with a cutting tool. A small portable track grinder is then attached to the lathe tool rest. This is driven electrically and the drum is revolved slowly in the opposite direction to the grinding wheel. By mounting the grinder on the tool rest the grinding wheel can be moved in or out and back and forth as desired. The grinder which we use runs at a speed of 2,750 r.p.m. and a beautiful finish results.



Brake drum set up in lathe for grinding

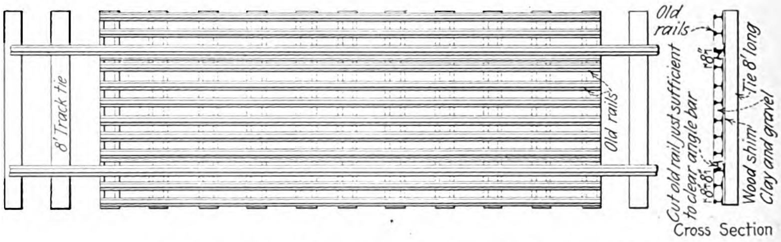
TRACK AND WAY DEPARTMENT—4

Old Rails Used for Railroad Crossings*

BY F. H. MIDGLEY
Engineer Grand River Railway and Lake Erie & Northern Railway, Galt, Ontario

TO EFFECT economy in the cost of renewing planking of highway crossings, our systems have adopted a crossing made up of scrap rails as shown in the accompanying illustration. Plank crossings last but eight months, while the crossings made by using scrap rail are good practically for all time with an occasional disturbance to renew the crossties.



Method of making crossing by use of old rails

Our running rail is 85 lb. and we use 56-lb. scrap rails laid parallel to the tracks for the full width of the ties, spiking them to the ties at about 8 in. centers. To provide flangeways the rails adjacent to the running rails are laid on edge. The space between rails is filled in with gravel and clay and sprinkled with crude oil about twice a year. We have put in many crossings of this type on paved streets, and municipal and other officials have expressed themselves as being perfectly satisfied.

The cost of a 20-ft. crossing laid with rail is $20 for twelve 56-lb. scrap rails 20 ft. long, approximate weight 2 tons, and $18 for the labor of installation, making a total of $38. The same length of crosing laid with 4-in. planks would cost $40.50, made up of $19.20 for six pieces of planking 4 in. x 12 in. x 20 ft. long, two pieces of 56-lb. scrap rail $3.30 and the labor of applying $18. The initial cost of the rail crossing is less.

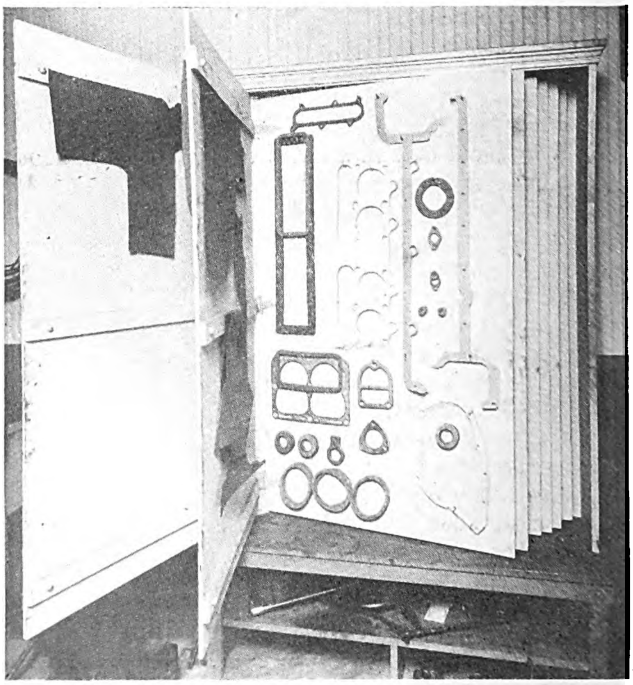
BUSES AND TRUCKS—2

Hinged Gasket Boards Conserve Space*

BY ROBERT M. O'BRIEN
Superintendent of Rolling Stock and Shops New Orleans Public Service, Inc., New Orleans, La.

THE accompanying illustration shows a type of gasket board that is proving of particular benefit at our bus garage. It consists of nine hinged boards or leaves which fold up like a book. The capacity of such a board for a given amount of space is obviously very large. In addition to this the advantage of having gaskets hung neatly so that they cannot be bent or broken is proving of particular advantage. Certain leaves are used for different types of buses, so that the location of any particular gasket becomes but a moment's job. Depletion of the stock is very noticeable with this type of board.



Gasket boards are hinged so as to fold into a small space

Improved Equipment

Additional Tools for Electric Railway Maintenance

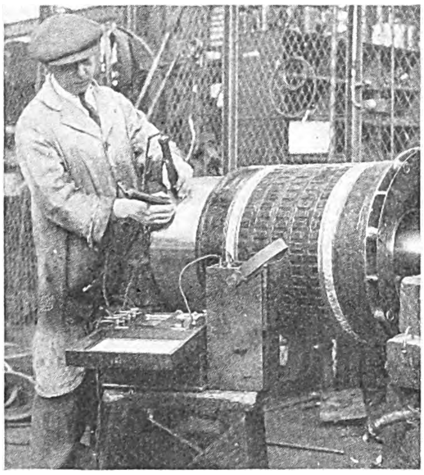
MANY letters of commendation have been received from our readers regarding the value of short descriptions of improved equipment for railway maintenance. We started the publication of such items in the March 19, 1927, issue, in which sixteen pages were included. Additional items were published in the April 16 and May 21 issues and now we are adding the fourth installment. Such descriptions of the latest tools which can be adapted to electric railway maintenance work enable those responsible for maintenance practices to visualize the shortcomings of their particular equipment and provide for changes which will put their maintenance work on a higher plane. Modern tools speed up repairs and assist in making a railway prosperous.

◆

Low Resistance Test Set

EVERSHED & VIGNOLES, LTD.,
Chiswick, London, England

FOR testing railway armatures, locating bad rail joints or other low resistance measurements a direct reading low resistance ohmmeter known as the "Ducter" is available. This set gives direct readings of resistances from 5 ohms down to 5 microhms and as no adjustments are required observations can be taken very quickly. The method employed for testing armatures is shown in the accompanying illustration, which was taken in the Durnsford Road repair shop of the Southern Railway, London, England.



The "Ducter" test set consists of two coils mounted on a common axis and swinging in the field of a permanent magnet. The coils are fixed at a definite angle on their mounting and carry a pointer moving over a scale marked in microhms. Current is supplied by a battery and the current or control coil is tapped across a shunt in one of the battery leads and, therefore, carries a current proportional to the total current flowing in the main circuit. The potential coil is tapped off the resistance under test and carries a current proportional to the potential drop across the resistance. As the movement is not controlled by any other forces, its final position is dependent only on the ratio of the total current to the potential drop through the resistance. Fluctuations in battery current have no effect on the accuracy of the readings within ordinary working limits.

Axle Lathe

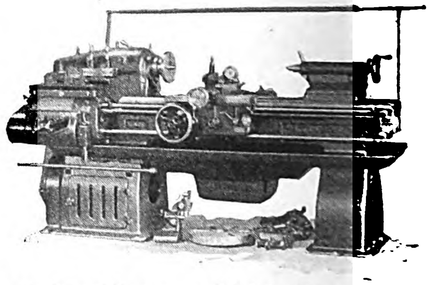
NILES TOOL WORKS COMPANY
Division of Niles-Bement-Pond Company,
Hartford, Conn.

DESIGNED for production work on axles, the bed of this lathe is rigid and is reinforced by cross-girts of box section 8 in. wide. The carriage bearings consist of a flat way at the back of the bed and a way of compensating V shape at the front, with angles of 15 deg. and 70 deg. The center driving head completely incloses the main driving gear, forming an oil reservoir for it. It is adjustable longitudinally along the bed. The main drive is by a large steel herringbone type gear and pinion carried between bearings in the head. The two carriages have power longitudinal feeds, by a right and left-hand screw positively driven by gearing. A complete lubricating system for the tools consists of pump, jet pipes, reservoir and collecting channels. The tool slides have a trough connected with channels in the carriage bridge for carrying off the lubricant. The aprons are double-walled and all of the mechanism, except the operating levers, is completely inclosed, as are the feed gears, at the right-hand end of the bed. The carriages have hand traverse on the bed and the tool slides have hand cross feed. The axle is carried on dead centers mounted in two heavy tailstocks, which are adjustable longitudinally along the bed and can be clamped in position by four anchor bolts. To prevent slipping, a pawl engages a rack cast in the bed. A handwheel adjusts the spindle of the right-hand tailstock. These machines can be driven by a single or cone pulley or by a constant or adjustable speed motor.

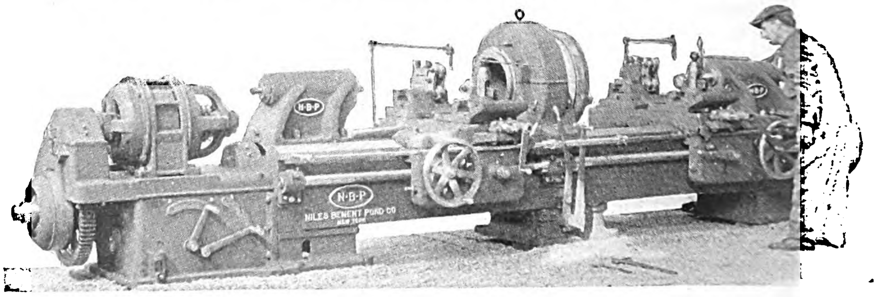
16-in. Lathe

PRATT & WHITNEY COMPANY
Division of Niles-Bement-Pond Company,
Hartford, Conn.

LATHES of this type can be furnished either with a geared head for independent motor drive, with a single pulley or with a cone pulley head for belt drive. The back gears of the headstock are mounted below the spindle. The headstock is centered over the bed and the operator is given greater freedom of movement and uninterrupted light on the work. The sliding speed change gears are made of hardened chrome-vanadium steel. They are fully inclosed and splash oiled and are shifted by two levers on the front of the head. The cone head has a solid housing and the same back gears as the gear head.



The positions of the ratio lever and rocker arm for any desired feed or thread are located by a large direct reading index plate mounted on the quick-change gear box. The compound rest handwheel is set at an angle of 20 deg. above its screw. This allows headroom and provides space for a large legible dial graduated in half-thousandths to conform to micrometer readings. The lever operating the combined stop and reverse rod is located at the right end of the apron. For fine threading the handwheel may be disengaged from the rack pinion through the knob to the right of the large handwheel. The apron is also equipped with

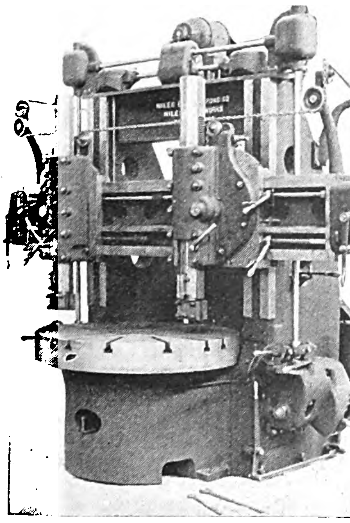


the usual knob for power cross feed and lever for engaging the screw. A taper of 45 deg. may be cut by the simultaneous use of both cross and longitudinal power feeds. The tailstock has a long solid barrel and a large graduated spindle. It is clamped to the end by an eccentric shaft parallel to the spindle, and the same handle provides a means of moving it along the bed.

Boring and Turning Mill

NILES TOOL WORKS COMPANY
Division of Niles-Bement-Pond Company,
Hartford, Conn.

BOX-GIRDER, double-webbed housings without an opening in the front are used in this boring and turning mill, the cross rail elevating screws being located between them. They are bolted securely to the bed and are tied together firmly by a heavy top brace. The table, supported by an annular bearing, running in a bath of oil, is driven by a bevel gear. For clamping purposes the table is regularly provided with four pairs of parallel T-slots and eight radial T-slots. The spindle is long, of large diameter, and has upper and lower bearings. The box-girder cross rail is of the three-track type, having a narrow guide at the bottom with a saddle traversing screw located between the guiding surfaces. The saddles have accurately scraped bearings on the cross rail. The boring bars are steel forgings of octagon section. The tool holders are steel forgings with provision for clamping tools for boring, turning and facing. They have straight shanks and may be easily removed for the insertion of special boring bars or cutters. The feeds are positive, continuous and independent for each head, both in amount and direction.

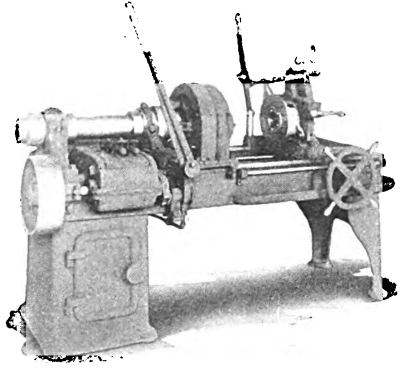


Eight different feeds for cross, vertical and angular feeding can be obtained by levers on the two feed boxes. Rapid power traverse for the saddles and boring bars is controlled by a lever located above the feed box and near the work. This lever has four positions, two of which engage rapid power traverse in either direction and the other two engage power feed, fine and coarse. The machine can be driven by a belt or by means of a constant or adjustable speed motor.

No. 2 and No. 3 P.D.Q.C. Improved Pipe Machine

BIGNALL & KEELER MACHINE WORKS
OF THE N. O. NELSON MANUFACTURING COMPANY,
Edwardsville, Ill.

MACHINES of this line take their name from the use of the Peerless die and quick chuck. They are said to have proved popular for threading small sizes of pipe. The cut-off tool is made of beveled high speed steel, and the reamer and thread-length gage aid in producing good work. Designed for single pulley operation, a constant speed electric motor can be used if desired. Shifting the gears in the gear box permits of obtaining six spindle speeds. The Peerless die head is provided with five dies per set. The die has a full bearing against the cam ring. Turning the adjusting screw expands or contracts the dies for threads of different gages. The quick acting chuck is made with tempered tool steel grippers with M form teeth which can be sharpened. A Landis die head can be furnished.

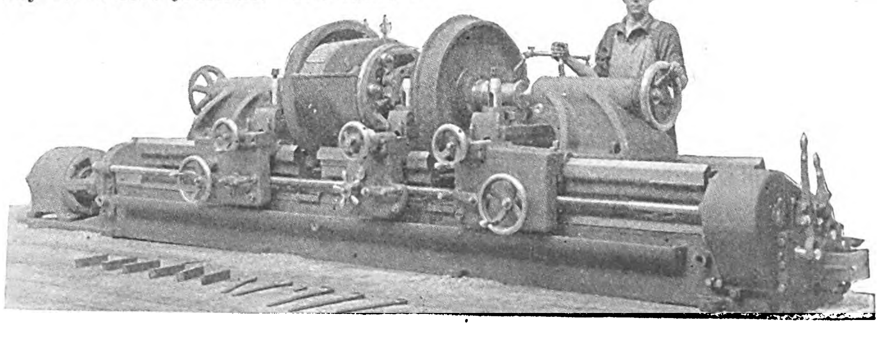


The No. 2 machine is capable of handling $\frac{1}{4}$-in. to 2-in. pipe and the No. 3 $\frac{1}{4}$-in. to 3-in. pipe. The No. 2 machine occupies a floor space of 28 in. x 77 in., whereas the No. 3 occupies a space of 30 in. x 90 in.

Combination Journal Turning and Axle Lathe

NILES TOOL WORKS COMPANY
Division of Niles-Bement-Pond Company,
Hamilton, Ohio

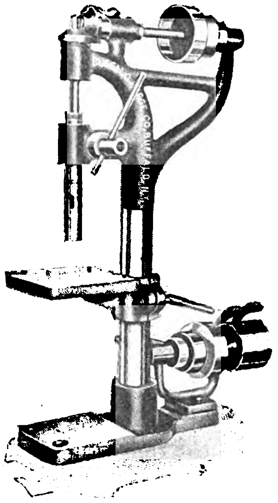
EITHER outside or inside journals can be turned simultaneously with this machine on axles having wheels up to 42 in. diameter on the tread, with wheels in place. When being used as an ordinary axle lathe, the outside carriages are arranged for turning collars, outside journals, sand guards and wheel seats, when the wheels are not in place. The inside carriages are used only for inside journals. The lathe is of the center drive type, the top portion of each end of the bed being arranged to slide and thereby forming gaps to allow mounted wheels to clear. The center driving gear has a projecting sleeve or bearing on each side and the gear is in halves, the drive being by a pinion carried in the bed. The center head has a hinged cap which completely covers the center gear and forms a continuous bearing for it. The four carriages are fitted with longitudinal feeds by screw and bronze nuts of the open and closed type. The tool slides on the outer carriages have hand cross feed and those on the inner carriages have hand and power cross feeds. Burnishing attachments are furnished on the two outside carriages only. Two tailstocks carried on the upper bed members have spindles which are adjusted by means of hand wheels.



Power Bench Drill

BUFFALO FORGE COMPANY.
Buffalo, N. Y.

CORRECT alignment of gears and shafts in the Buffalo 10-in. power bench drill shown is insured by its substantial one-piece frame. The upper cone pulley is supported between the bearings instead of being overhung. This reduces unnecessary strain on the shaft. The countershaft has tight and loose pulleys and a belt shifter. Feed lever and spindle are held by means of a friction spring, assuring the spindle remaining where placed. The work table is adjustable up and down or can be pushed to one side. The bench can also be used as a table, since it is planed carefully and accurately and has countersunk bolt holes. It will drill holes up to $\frac{9}{16}$ in. with great speed.



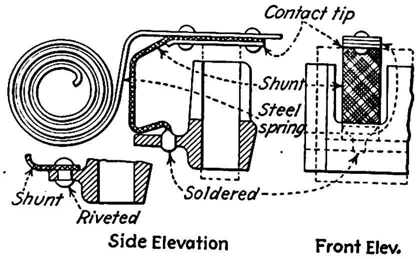
Combination Riveting and Brake Relining Machine

RELINING of bus brakes and for countersinking and riveting is the function of a new type of equipment put out by the Manley Manufacturing Company, York, Pa. The machine consists of a drilling and countersinking mechanism, together with a heavy-duty riveting machine mounted on a support that serves as a bench. This has heavy iron legs with a natural wood top. A clamp is provided for holding the brake lining while cutting. A rod for holding the rolls of brake lining is also provided.

The drilling and countersinking machine operates on a different principle from that usually employed. The hole in the brake lining is drilled independently, using the holes in the brake band as a templet. The countersinking is done from underneath by reverse action.

Twin-Washer Brush-Holder Mechanism

TO MEET the demands of a large number of railway operators for a brush-holder pressure finger with few wearing parts and one which can be applied generally to a large number of old and new types of railway motor brush-holders, the Westinghouse Electric & Manufacturing Company has developed the twin-washer type brush-holder mechanism. The entire movement over the brush range is obtained by the opening and closing of the spring itself, there being no movement between the barrel and the shaft. Adjustment of pressure is made only in the shops.



Method of attaching shunt to new type brush-holder mechanism

The finger is designed to use a twin-washer and a barrel adjustment on a $\frac{3}{8}$-in. diameter spindle instead of the harness with ratchet and pawl. The twin-washer limits side play of the spiral spring and the barrel gives a satisfactory adjustment. The end of the spiral spring extends out over the carbon box and has a flat contact tip and a braided shunt riveted to it. This provides a contact tip that is easily renewed. The end of the shunt is twisted and soldered into a $\frac{7}{32}$-in. diameter hole in the bottom of the casting.

The new pressure finger is interchangeable with all of the harness type fingers using a ratchet and pawl with a few minor changes. To mount the new fingers in old brush-holders, the $\frac{5}{16}$-in. hole for the spindle should be reamed to take the new $\frac{3}{8}$-in. spindle. A $\frac{7}{32}$-in. diameter hole should be drilled in front of the two holes that were used for the spring clips and the shunt soldered into the casting. After assembly a hole should be drilled through the casting and spindle for a $\frac{1}{8}$-in. cotter to anchor the spindle to the casting.

Dick Prescott Shows His Spirit

And Wins the Men

WHEN Dick Prescott, assistant superintendent in the Consolidated Railway & Light Company's shop, started for the truck shop with Bill Johnson, the foreman, the young executive did some very fast thinking. Consequently as he approached the group of workmen idling at one corner of the shop, after having refused to go to work, he had determined his course of action.

Dick knew that he had little chance of successfully handling the situation if he permitted himself to be drawn into a purposeless argument with the entire disgruntled group. On the other hand, he had come to the shop himself to face them instead of sending Bill Johnson back with a message.

As he entered the shop the men saw him coming, and there was an ominous silence.

Dick stopped and surveyed the group for a moment before speaking.

"What's the trouble with you men?" he asked. "Why aren't you all on the job?"

"Aw, dis is a helluva shop t'work in," spoke up "Shorty" Green, pal of Pete Welcher and one of the instigators of the present trouble, who was standing far enough back in the crowd to think he was out of Dick's sight.

"I wish the man who made that remark would step out here where I can see him," quickly snapped Dick. Nobody moved. After waiting for a moment the young executive, though realizing that this was a critical moment, spoke deliberately.

"I don't know what you men have on your minds," he said. "If any of you have received unfair treatment, either at my hands or by one of the foremen, I want to know it.

"This is a good shop to work in. No man who is doing an honest and capable day's work needs to worry about his job. But this sort of thing won't go. My door is always open to any of you who has a fair grievance. I want you to get on your jobs immediately. If there is something you want to bring to my attention, select three of your number and send them to my office during the lunch hour today. I shall be glad to talk with them then."

Dick turned on his heel and walked away from the group, which remained silent for a moment after he had gone.

"I think dat's a damn sensible suggestion," remarked big Pete Thompson, glancing after the disappearing form of Dick Prescott. "Why should we all act like a lot of nuts just because a few guys get what they think is a grievance. I think it's a grouch, not a grievance. If some of you guys would do more working and less talking you wouldn't have so many troubles. I notice Shorty back there did a helluva lot more talkin' before the boss got down here than he did when he had a chance to tell his troubles to somebody who could do somethin' about it."

"Why didn't you say something?" queried Shorty.

"I ain't the guy dat started dis." snapped back Pete. "Dis is a good job and I don't want'a lose it, either. I'm goin' back to work."

Pete was soon followed by some of the others, and after a few moments even the ringleaders of the movement reluctantly gathered up their tools and resumed work.

Association News & Discussions

Don't Be Too Easily Satisfied, Urges President Sawyer

President Sawyer, Managing Director Storrs, Charles Gordon and J. W. Colton Give National Perspective of Industry to Midwest Electric Railway Men During Annual Meeting

"WE ALL need a mental inventory," declared W. H. Sawyer, president of the American Electric Railway Association, in addressing the annual meeting of the Mid-West Electric Railway Association, held in St. Louis, Mo., on June 9-11, 1927.

"As I have traveled to various cities and talked with railway men who are doing things," said the national president, "I have become convinced that most of us who have been inclined to feel that we are doing a fairly good job are barely scratching the surface of the possibilities for progress in many directions. I believe that we need a mental inventory. We have been too easily satisfied. There are many opportunities for improvements in practices on our properties and in our method of conducting operations that will improve the showing on our balance sheets. On every hand there are examples of properties that are doing an improved job. If we will combine on our own properties each advance step taken by those who have been going ahead in certain directions, the opportunities for improving the condition of our properties are manifold. If we will open our eyes and our minds to what others have already done we can find many things in successful practice which we have dismissed as impossible. Likewise, there are many suggestions for new ways of improving performance and net revenue."

Speeding up of service was one of the things that Mr. Sawyer mentioned specifically as offering ample room for improvement on most properties, once there is the determination to go ahead despite obstacles and objections.

Increase of courtesy on the part of employees was cited as another example of a wide field for improvement despite the progress which has been made in this direction. The management's own performance in transmitting inspiration to its employees was still another phase of the present-day problem which the speaker felt could profitably be subjected to critical and intensive analysis on most properties. Likewise, the practices and methods in the shop, and maintenance performance in general were held to be subject to substantial improvement. In acquiring a knowledge of merchandising and advertising methods and their application to the transportation business, the industry has barely started, according to Mr. Sawyer. In working out the proper methods and angles of approach for the improvement of community relations, there is much more to be learned than is now known. Only a start has been made in the improvement of cars and the character of the ride sold by most railway properties.

"Public transportation is a necessity to community existence and progress," continued Mr. Sawyer. "It must be furnished by some agency. If the men now at the helms of these many properties don't find a way to provide better transportation, somebody else will. Improvements will be made, either by us or by some one else. This convention will have been most successful if we each leave here convinced that we have not been doing all that it is possible to do; if we leave with the determination to go back to our properties questioning every method and every precedent that we have been inclined to consider good enough, or the best that could be expected in the circumstances."

COMING MEETINGS OF *Electric Railway and Allied Associations*

June 19-23—**International Street and Interurban Railway Association, annual conference, Copenhagen, Denmark.**

June 20-24—**American Society for Testing Materials, 30th annual meeting, French Lick Springs Hotel, French Lick, Ind.**

June 20-24—**American Institute Electrical Engineers, convention, Book-Cadillac Hotel, Detroit, Mich.**

June 24-25—**New York Electric Railway Association, annual meeting, Hotel Champlain, Bluff Point, N. Y.**

June 26-27—**Public Utilities Advertising Association, Hotel Albany, Denver, Col.**

June 29-July 1—**Central Electric Railway Association, summer meeting, Book-Cadillac Hotel, Detroit, Mich.**

June 30-July 1—**Tramways and Light Railways Association, annual meeting, Bath, England.**

July 22-23—**Central Electric Railway Accountants' Association, Tuller Hotel, Detroit, Mich.**

July 27-29—**Association of Equipment Men, Southern Properties, 12th semi-annual meeting, Atlanta, Ga.**

Sept. 8—**Central Electric Railway Master Mechanics Association, South Bend, Ind.**

Sept. 13-15—**International City Managers Association, Dubuque, Ia.**

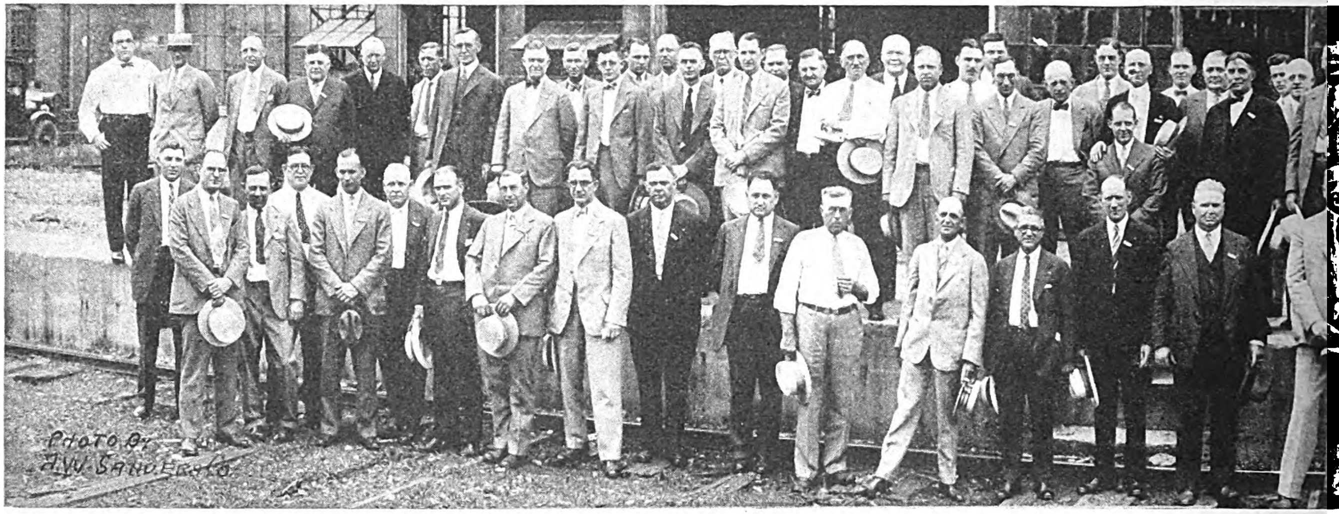
Oct. 3-7—**American Electric Railway Association, annual convention, and exhibit, Public Auditorium, Cleveland, Ohio. Exhibits open at noon of Oct. 1.**

Mr. Sawyer pointed out some of the signs of progress which he had observed in visits to various properties. He said that the transportation systems in most of the larger cities of the country have definitely turned the corner and are going forward. He mentioned Chicago as a city in which the railway, though a part of the lines are technically in receivership, is making improvements rapidly and is actually on a profitable operating basis.

Milwaukee was cited as another example of real progress. New track is being built, cars are being improved, new lines on private right-of-way are being put in to speed up suburban and interurban service. "In Milwaukee they are spending large sums of money for the betterment of service," he said. "They believe in the electric railway business, and they are backing their opinion with good money. They are looking not to tomorrow, but into the future—five years, even ten years in some cases. They are making plans there that promise to give Milwaukee one of the finest transportation systems in the country. They are trying to not only meet the needs of the city but to anticipate them. They have met opposition at each step, but they are determined to progress, and the results they are accomplishing more than justify their spirit and confidence.

"I had the pleasure of talking to 700 graduates of educational classes in the employees' mutual benefit association in Milwaukee. There were 700 employees who are trying to better themselves. It was an inspiration to me. On that property they have succeeded in arousing an incentive and a spirit that has few parallels in our industry. The management there is getting co-operation from its employees because it is giving co-operation."

Referring to the work of the American Electric Railway Association, President Sawyer explained the reasons for the proposed revision of dues that will be submitted to the coming convention in Cleveland. He called attention to the low rate which has existed in the railway association in comparison with the other utility asso-



Delegates to the annual meeting of the Mid-West

ciations. He pointed out that the revised constitution is to be submitted only after a very careful study has been made of all the association's activities, with a view of ascertaining that the industry is getting full value for its money.

He also outlined the changes which are to be made in the association's magazine, *Aera*, including elimination of advertising and reduction in the number of pages of general articles suitable for publication in the technical press. Through reduction in bulk it is hoped not only to save money but to make the information published more readily available. At the same time an effort is to be made to direct *Aera* more definitely to the purpose of promoting the association and the industry through fuller interpretation of the work of the association and its committees and through publication of material that will be inspirational to individual member employees. Fuller co-ordination between the association and the industrial press was given as another reason for the change.

After having visited the National Electric Light Association convention at Atlantic City, President Sawyer said that he was more convinced than ever of the wisdom back of the decision to take the railway convention to Cleveland a second year. He said that a recent visit to Cleveland impressed him with the fact that the convention committee there is on its toes and that satisfactory arrangements are being made rapidly. More than 80,000 sq.ft. of exhibit space had already been sold in comparison with 60,000 sq.ft. at the same time last year. One of the most promising features of present developments is the assurance of a car exhibit that will probably exceed that of last year in point of size and interest.

Although neither Lucius S. Storrs, managing director of the association, nor J. W. Colton, editor of *Aera*, was able to be present personally, papers which they prepared were read by Labert St. Clair of the association staff. Mr. Colton discussed the subject of municipal ownership of railways in the United States, outlined the history of the municipally owned properties in the country and cited their records of experience to refute the contention by municipal ownership advocates that public ownership and operation, with its attendant political meddling, has any advantages for the riding public.

Mr. Storrs again called attention to the need for co-operation between management, public and employees. He outlined the fundamentals to successful local transit as laid down by the advisory Council, emphasizing the obligations of each of the three groups that have an interest in transportation. He considered it significant that transportation progress has occurred rapidly wherever the three groups have abided in the main by the principles necessary for fair dealing.

Mr. Storrs declared that the industry is making definite progress in many more cities than is generally recognized. The fare issue, which was once the chief cause of controversy in almost every city, no longer is the dominating one in most communities.

"I have seen many complicated transit situations," concluded Mr. Storrs. "Some of them seemed too tangled ever to be straightened out. But I have found that when citizens of constructive minds, business men and other leaders who had the welfare of their communities at heart, began to take an interest, the negotiations got some place."

Another national view of the railway situation was given in an address entitled "You Can't Sell Cotton Goods in a Silk Age," by Charles Gordon, editor of ELECTRIC RAILWAY JOURNAL, which is printed elsewhere in this issue.

WELCOMED BY MAYOR

Victor J. Miller, Mayor of St. Louis, welcomed the Mid-West Association to the city. In responding, A. T. Perkins, manager for the receiver of the United Railways of St. Louis, said that the backing of responsible business people is essential in establishing improved public relations. In winning this backing, he said, there are two ideas which have not been sufficiently developed, namely, that the electric railway is a large buyer in the local market and railway employees constitute a large body of retail customers whose jobs depend upon the continued existence of the transportation company.

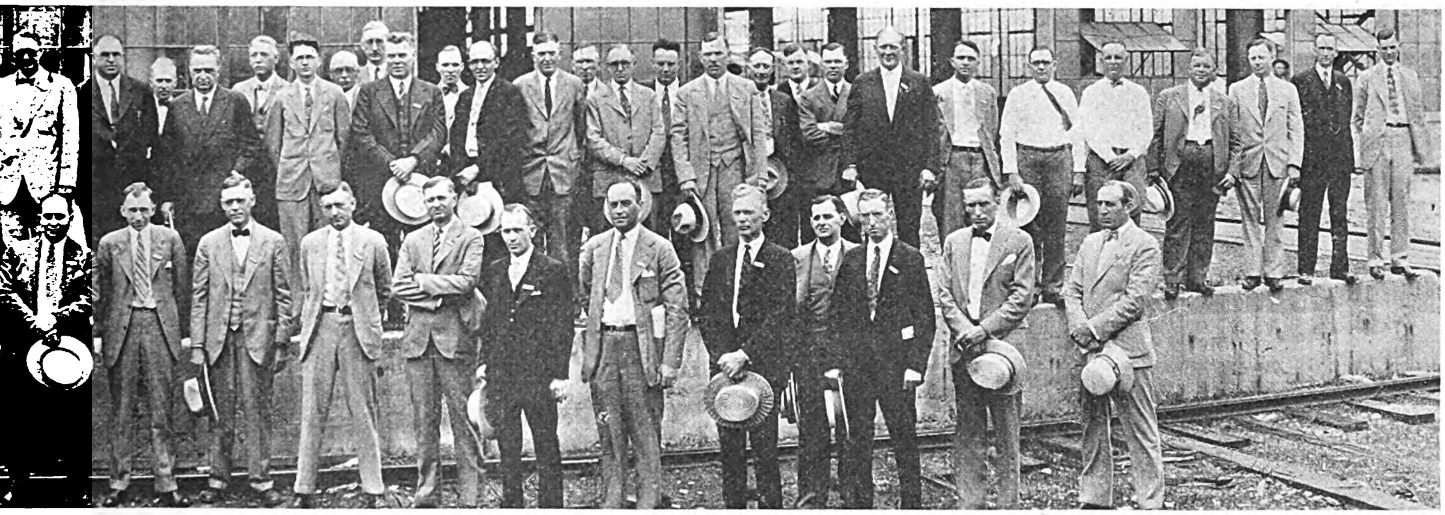
As an example of the importance of a railway in the local market, Mr. Perkins said that his property purchases 18,000 different items of material and supplies from 900 factories in the St. Louis district and at an annual cost of $3,000,000. From the standpoint of employee purchasing power the speaker estimated that the 6,000 employees of the United Railways, a large part of whom are buying homes, constitute with their wives and children some 20,000 retail customers.

Dr. Robert Hyland, chief surgeon United Railways of St. Louis, talked on the work of a medical department in a railway organization and its importance in keeping employees contented and efficient through care of their health.

A question regarding the proper basis for setting up pension reserves, so as adequately to meet the need of increasing age among employees was raised by F. G. Buffe, vice-president and operating manager Kansas City Public Service Company. Adequate reserves are necessary, in the opinion of Mr. Buffe, to take care of the reduced turnover with advancing age which results from a pension system.

"The Human Element in Industry" was the subject of an address by E. S. McClelland, director of personnel Westinghouse Electric & Manufacturing Company. He defined the personnel department of an organization as the agency responsible for breathing into it and maintaining the spirit of its founder. Maintenance of a proper morale among employees, he explained, involves dealing with the elusive and delicate reactions of human nature. Credit and adequate recognition of the worker's part in any business organization was held to be essential to effective teamwork.

J. B. Sheridan, secretary Missouri Committee on Public Utility Information, talked on the value which utility service confers upon communities. He said that undeveloped land has little value for residential or business purposes until transportation and other utilities come in. The average real estate dealer does not sell only land. The value of utility service is a large part of the selling price, and the land speculator pockets the profit while the utilities continue to bear the burden of



Electric Railway Association held at St. Louis June 9-11

rendering service in sparsely settled territory. It is this interest of the land speculator, not the public itself, which produces the continuous pressure for railway extensions into new territory.

Speakers at the banquet on Thursday evening, held on the roof of the Chase Hotel, included the Rev. R. J. Wilbur, J. H. Brod, director of safety City of St. Louis; Senator Gardiner and J. C. Hall, counsel Missouri Association of Public Utilities.

H. B. Cobban, general manager Northeast Oklahoma Railroad, was elected president for the ensuing year. F. G. Buffe was elected first vice-president, R. J. Lockwood second vice-president and J. A. Weimer was re-elected secretary-treasurer. The following executive committee was also selected: A. E. Reynolds, R. A. Leussler, H. W. Patten, B. Hilburn, B. W. Frauenthal, D. L. Fennell, J. L. Adams, R. B. Campbell.

President Reynolds reported the receipt of an invitation to hold the next meeting of the association in Hot Springs, Ark. Mr. Buffe also extended an invitation on the part of Kansas City to hold the next meeting there. The time and place were left in the hands of the executive committee.

Preservative Treatment of Pine Poles*

By E. E. Boehne

International Creosoting & Construction Company

USE of creosoted pine poles, according to government statistics, increased 500 per cent between 1920 and 1925. Five hundred thousand were installed in 1923. That number increased to 1,000,000 in 1924. This is particularly significant because it was the only species of pole the use of which materially increased during that period. Obviously a definite swing of the industry is represented here.

A pole's worth is measured by the length of time it gives satisfactory life in the line. What shortens that life in the great majority of cases is decay. Decay, then, and its prevention are prime points for consideration.

Decay in wood is caused by low forms of plants called fungi, and by bacteria. Through the secretion of little understood chemicals, they dissolve the wood fiber, and its substance serves as food for the fungus. The science of timber preservation consists in poisoning that food, the wood. Creosote is the poison. The operation of injecting it deeply into the wood by pressure is the work of the modern wood preserving plant. There are other wood preservatives, but creosote is the best known.

The first step in the creosoting of pine poles, or, rather, a step preliminary to their treatment, is to season them; that is, to remove a sufficient amount of the moisture which all freshly cut wood contains to permit the entrance of the creosote. This is accomplished either by allowing the wood to dry on a seasoning yard or by steaming it in the treating cylinders.

Two processes have recognized standing and are in general use for pole treatment. They are the Bethel process, using 12 lb. of creosote per cubic foot of wood and leaving the wood cells full of creosote after treatment, and the Rueping process, retaining 8 lb. of creosote per cubic foot and leaving the wood cells partially empty after treatment.

In the Bethel process, after the material is placed in the cylinder, a vacuum of about 24 in. is maintained until the wood is as dry and free from air as practicable and then, without first breaking the vacuum, the cylinder is completely filled with the creosote oil. After the retort is filled, additional creosote is forced into the cylinder by means of pressure pumps, the pressure being gradually raised to and maintained at not less than 125 lb. per square inch at a temperature of 180 to 200 deg. F., until the required amount of the preservative has been forced into the wood. The pressure is then released, the oil drained from the cylinder and another vacuum drawn. The object of this final vacuum is to remove the surplus creosote from the surface of the timber, thus making the wood drier on the surface and cleaner to handle.

In the Rueping process, as the first step, air is pumped into the cylinder and thus into the wood under high pressure; then while this air pressure

Correct method of stacking poles in seasoning yard. Uniform spacing, wide alleyways between stacks and creosoted separating strips between each layer of poles provide thorough, even air seasoning

governed by many factors such as quality and design of vehicle, nature of service performed, mileage performed per year, nature of routes and pavement, efficiency of maintenance and competence of drivers. Operation over rough roads and cobblestone pavement will cause premature body destruction. Heavy standee overloads will cause quick deterioration and failure of chassis and running gear. Incompetent drivers may wreck the engine and running gear while body and chassis remain in excellent condition. Inefficient maintenance methods will quickly result in wreckage of all the parts.

Owing to limited experience in bus operation, it has, so far, been the general practice to apply a flat average rate of depreciation to the vehicle as a whole. Further experience may guide us to the more rational practice of applying different rates to the various main members of a bus. This discussion does not permit of lengthy reference to the many methods that are used for the setting up of depreciation reserve funds. It is sufficient to say that the ultimate end of all these is the same, viz., that by setting aside each year, out of earnings, a sum proportionate to the depreciation in capital value of the equipment, a fund is established for the purchase of new equipment when, through usage or obsolescence or inadequacy or a combination of all these factors, renewals become necessary.

It is generally considered inadvisable that such a fund should be carried as an inert bank deposit. It may be reinvested or drawn upon for other purposes, provided always that it shall continue to earn and be credited with the normal rate of interest and be available for its legitimate use when required.

Owing to the difficulty of differentiating sharply between repair and replacement costs, it is common and perfectly sound practice to combine these costs and to set aside, each year, or when most convenient, specific sums to take care of both. The danger attendant upon this practice is that the setting aside of a sufficient sum to liquidate both liabilities becomes a matter of expediency and, unless the business is very profitable, there is a tendency to set aside an amount which fully covers the actual expense of making repairs but which does not leave a credit balance in proportion to the accrued depreciation.

When there is a clean-cut division made between these two accounts, there is the constant likelihood of minor renewals being made at the expense of the repairs account. These should normally be financed by withdrawals from the depreciation reserve account. Otherwise, this practice will obviously result in an undue inflation of the latter account and the balance sheet will not be a true statement of the financial status of the undertaking.

Furthermore, if a separate account covering interest on equipment is set up, it is obvious that since the depreciation reserve account is earning interest on the depreciated capital value of the equipment, revenue account should only be charged with interest at normal rate on the remaining capital value of the same equipment. In other words, if the income account is being debited yearly with a sum sufficient to cover accrued depreciation, without regard to interest, during the life of the equipment, the credits to interest account should be based on the average value, or one-half of the cost of the equipment. The same end is attained if interest on investment is carried at the full rate and the interests earned by the depreciation fund are credited back to income account.

Regardless of the method employed to attain that end, the principle to be followed is that funds be set up in some way to make necessary renewals of equipment when these are due without having to raise new capital to buy new equipment when the physical assets supporting the original investment have disappeared.

The question as to whether the rate to be applied against earnings to cover depreciation is to be based upon the element of time or upon usage is not of primary importance. If the factors of obsolescence and inadequacy can be ignored, which is seldom the case, there is no doubt that deterioration of physical and capital value will be in proportion to the usage or service rendered by the machine.

If we could anticipate the exact mileage that would be performed each year by a vehicle and could accurately estimate the mileage performance within the economical life of the vehicle, it would make little or no difference which method was adopted. However, since new buses are naturally called upon to do the heaviest part of the work and since the performance of the older buses becomes less and less as time goes on, the application of depreciation charges on a mileage basis has the advantage that the impairment of capital value is being absorbed each year in proportion to the earning ability of the bus. Furthermore, it is easier to estimate the probable ultimate mileage performance of the bus than to estimate the number of years that an old bus will continue to justify its existence in limited service.

Another factor in favor of the mileage basis is that a bus of normal grade and promise of normal life may, through some inherent deficiency, not be as popular as other types, and therefore, not be used to the same extent.

A rate based on a fair estimate of ultimate mileage performance will meet the variations in the usage factor with greater certainty.

Canadian bus operators cannot make direct comparisons of costs with those in the United States. Our fiscal policy dictates that we must pay 40 per cent more for our vehicles than our neighbors. This means that our interest and depreciation charges must also be 40 per cent higher.

The Fifth Avenue Coach Company of New York has had the largest experience of bus operators on this continent. Reference to its financial statements shows that the average proportion of depreciation charges to capital invested in equipment at the end of each year for the past three years is about 14½ per cent. This would indicate an applied rate of about 16 per cent of the average capital value of equipment during these three years.

A comparison of figures available relating to operation in New York, Youngstown and Montreal is of interest.

When comparing these figures it is to be noted that bus practice in New York has been fairly well standardized for several years and that Youngstown figures represent the performance of a fairly large proportion of older and less efficient buses.

Performance in Montreal, so far, indicates that a tapering down of depreciation charges from the existing 20 per cent basis will be quite in order and that a figure of about 4 cents per mile will cover the deterioration of the high-priced, larger vehicles as well as the cheaper and smaller vehicles, which may be expected to deteriorate at a faster rate.

Simplifying Car Inspection*

By J. E. Watkins

Superintendent of Rolling Stock,
Winnipeg Electric Company

PROPER inspection of cars is, as you are no doubt aware, most difficult to have repeatedly performed, as it becomes a routine. To facilitate matters, specific instructions ordinarily are issued, but this appears not to simplify the operation and only to make it more complicated. When the inspector performs his duty, everything should be noted during his passage through the car. A form, similar to the one reproduced, has been found by the Winnepeg Electric Company to be most advantageous, as in starting at the back of the car, beginning with the rear entrance step, he is able to note the defects by inserting a cross (X) opposite the particular one which is found. The safety points, whose condition must be maintained at all odds, are particularly drawn to his attention by black dots.

It has been acertained that better results are achieved by reducing to a minimum the amount of writing on the part of the inspector. This is the reason for inserting a cross only. The manner in which this form is compiled helps greatly in securing a good report.

It is considered by this company a safe and economic system to inspect on the following basis: 750 miles for mechanical defects, 1,500 miles for mechanical defects and lubrication. In

FOR BARN FOREMAN'S USE ONLY

Car O.K. except for the following:—______

(Sgd.) ______ Barn Foreman

Above and at right, car inspection form

Front and back of car inspection form used by the Winnipeg Electric Company. Each defect is noted by an X opposite the item. Action taken is shown on the reverse side.

At left, trainmen's form for reporting defects in Winnipeg

the case of trippers, once a week for mechanical defects and once a fortnight for lubrication.

The completed report, after inspection, is handed to the shop foreman, who, in turn, passes it to the department concerned. Should more than one department be affected, the sheet is passed on from one to the other or if convenient, all deal with it simultaneously. It is then returned to the head office of the department and retained for a reasonable length of time (usually two years) or unless circumstances occur which may require a longer period of retention.

Reports of defects which are made by the platform men are not always to be relied upon, especially where the defect slip is handed from one to another. They generally do not look for defects, but rely on what the previous operator has found and quote "same as above."

After noting most of the articles which have been written on this subject, it seems that for better efficiency and standardization, pull-in, defect and general inspection forms should be adopted by the Canadian Electric Railway Association and a monthly interchange system adopted, so that we could keep more closely in touch with each property on such matters.

Bus Men Hold First National Meeting

Progress in Organization, Interstate Regulation, Relations With Rail Carriers and Stabilization of Bus Industry Occupy Attention of Rail and Independent Bus Operators at Get-Together Meeting

REGULATION of the motor bus and progress in national organization plans occupied a front-line position in the program at the first annual meeting of the Bus Division of the American Automobile Association held in Philadelphia on June 15-17, coincident with the annual meeting of the parent association. Although operation of buses was given a place on the program, the matter of bringing about unity of action among various classes of bus operators through perfection of the Bus Division's organization, extension of its influence, and the immediate problem of securing a desirable national legislation for the regulation of interstate bus operation overshadowed entirely any operating or technical questions. Considerable attention was given to the relations between independent bus operation and existing steam and electric carriers.

Rail Men Participate

It was particularly noticeable that the question of relations between rail carriers and intrastate bus operations by the established holders of certificates of convenience and necessity gave rise to very little discussion and that a generous proportion of rail-bus operators were represented in the attendance, on the program and in the councils of the association. Operation of interstate buses, both in long-distance service and in such service as that radiating out of New York City, however, provoked considerable discussion and difference of opinion.

Progress in the organization work of the Bus Division was reported by the secretary and by the chairman of the division's board, A. M. Hill. He outlined the present situation as follows: "When the Motor Bus Division of the American Automobile Association came into existence, through an organization meeting in Washington on March 19, 1926, the initial membership included twelve state bus associations representing about 1,100 operators and 6,000 motor buses. Today, fifteen months after its organization, the Motor Bus Division is comprised of nineteen state and district associations representative of about 1,900 operators and 16,000 motor buses."

On the outlook for further growth in the near future Chairman Hill said: "The close of this calendar year should see at least 30 state and district associations, representing about 2,500 operators and from 18,000 to 20,000 buses, included in membership."

Organization plans of the Bus Division contemplate membership primarily by state bus associations, although individual operators are eligible to direct membership in the national association under the provisions of the by-laws. Present membership, according to the secretary's report presented at the meeting, is as follows:

State and District Associations—Michigan Motor Bus Association; Oregon Motor Stage Association; Motor Coach Association of Washington; West Virginia Motor Transportation Association; Pennsylvania Bus Association; Motor Carriers Association of California; Illinois Motor Transportation Association; Ohio Motor Bus Association; Motor Bus Association of Virginia; Carolinas Motor Carriers Association; Kentucky Bus Association; Arizona Motor Carriers Association; Southern Bus Owners Association, Inc.; Dakota Motor Carriers Association; Maryland Motor Transportation Association; Oklahoma Motor Truck and Bus Operators Association; Nebraska Bus Operators Association; Wisconsin Motor Coach Association; Minnesota Bus Association.

Individual Companies—Public Service Transportation Company of New Jersey; Florida Motor Lines, Inc.; Orange Belt Motor Line.

BUS REGULATION DISCUSSED

Principles for the establishment of bus regulation were laid down by various speakers. S. A. Markel, chairman of the legislative committee, outlined the history of the division's participation in the effort to work out national regulation for interstate operation. He said that the committee hopes to have its own bus bill, which has been introduced in the House of Representatives, passed at the next session of Congress. In drawing this bill, the important matter of the determination of convenience and necessity for a bus operation was based on the principle that the character of the service to be regulated, should be considered. Mr. Markel also reviewed the recent hearings on bus operation before the Interstate Commerce Commission. He said that the one purpose of the railroads seemed to be to show loss in revenue attributable to bus operation. He maintained, however, that the bus men had been able to prove from the evidence that railroad passenger loss was attributable in large measure to the effect of the private automobile, not the motor bus.

F. O. Sanders, supervisor of bus operation for West Virginia, explained the way in which even interstate operations have been controlled in that state by exercise of the state's police powers, particularly as regards public safety. He said that both bus operators and public officials are pretty well agreed on the need for regulation, the only difference of opinion being as to the extent and character. In West Virginia regulation is not limited to common carrier vehicles operating between fixed terminals, but is applied to all vehicles operated for compensation. He expressed the belief that regulation of common carriers only leaves the road open for irregular operators to destroy the business of those that are regulated.

Concerning the field of bus operation, J. A. Ritchie, president Omnibus Company of America, speaking both as an operator and as a manufacturer, said that operations by his company in New York, Chicago and St. Louis fall into the class of mass transportation. Since the question of the suitability of buses for mass transportation was considered by Mr. Ritchie to be a controversial one, and since the electric railways of the country are the largest existing and prospective operators of this class of service he considered it advisable to leave the final determination of the field of the bus in this class of service to the judgment and experience of these companies. Mr. Ritchie emphasized the importance of the relations between management and men in the successful operation of buses. He declared it exceedingly important that the men be made to feel themselves associates in the business of providing public transportation and that they be encouraged in thinking about the improvement of service by welcoming and stimulating their suggestions.

The principle that the states have a large interest in interstate regulation of buses was declared sound by E. W. Wakelee, vice-president Public Service Corporation of New Jersey. He maintained that in delegating authority to the states under federal legislation care should be taken that the state act under its own authority up to the limit of its powers and as a federal agent only beyond that point.

T. R. Dahl, vice-president the White Motor Company, commented on the constructive character of the discussions and upon the soundness of the principles that had been presented. The general note of accord in the meeting was interrupted by the objections of T. A. Keppler, representing bus operators running to various points out of New York City. He advocated direct federal regulation of interstate operations instead of the delegation of authority to the respective state commissions.

Quoting John Marshall to the effect that, "The power to tax is the power to destroy," R. W. Taggart, president of the nationwide "Yellowway" bus operations, declared that the contention that bus operation in general is not profitable is untrue. He said that many present operators had started with no capital and that their continued existence is in itself proof of the profits made.

Prepared addresses during the meeting were presented by A. J. Brosseau, president International Motor Company; F. J. Scarr, consultant; B. W. Arnold, assistant general manager Chicago, North Shore & Milwaukee Railroad; C. T. McConnell, vice-president Ohio Motor Bus Association; H. G. Wells, public utilities commissioner from Massachusetts, and H. R. Trumbower, professor of economics University of Wisconsin.

Concerning the question of regulation Mr. Brosseau said: "The troublesome question of regulation is as yet unsolved. I am not an authority on the subject, but permit me to point out some elements which I consider fundamental.

"One of the chief virtues of the bus is its mobility. It does not run on rails, but it can go wherever there is an improved road.

"It is not costly to stop, hence it can pick up passengers at any point.

"Rates per mile should not be uniform unless road and other conditions are comparable.

"Regulation should not be based on rail or bus practice of today.

"Elaborate systems, such as apply to rail lines, are not needed.

"Disregard all or part of these factors and you will retard bus development and so hamper it as to deny the public the benefit of its use."

An abstract of Mr. Brosseau's address, together with some of the others presented, will be published in future issues of ELECTRIC RAILWAY JOURNAL.

Correct Wear of Trolley Wire

IN THE report of the Canadian Electric Railway Association meeting, issue of June 11, page 1051, J. F. Neild of Toronto is quoted as saying that with a 25-lb. trolley wheel pressure, No. 00 hard-drawn copper wire should be good for 3,000,000 wheel passes. The figure should have been 2,000,000 wheel passes instead.

American Association News

Entertainment

THE first meeting of the 1927 convention entertainment committee of the American Electric Railway Association was held at the Ambassador Hotel in Atlantic City on June 8. Tentative plans for the various forms of entertainment were discussed, committees were suggested and general plans carried forward so that they may be investigated and reported upon finally at the next meeting of the entertainment committee, which will be held at Cleveland, probably on Monday, July 11.

Chairman Edwin C. Faber presided. Other committee members who were present were Fred Dell, Harry Doyle, J. D. Porter, J. H. Blackhall, John A. Dewhurst, J. R. Welsh, J. O. Kennedy, Fred Bullock representing J. H. Alexander, E. E. Bodin representing Claude Van Auken, S. J. Cotsworth and E. F. Wickwire.

Rolling Stock

FINAL reports of the various special committees on rolling stock were considered by the general committee at a meeting held at association headquarters in New York, June 7 and 8. Those present were A. T. Clark, chairman; W. S. Adams, V. W. Berry, C. Bethel, R. S. Bull, R. W. Cost, M. R. Hanna, J. S. McWhirter, A. D. McWhorter, F. W. Sargent, Hugh Savage, E. S. Sawtelle, D. F. Smith, C. W. Squier and H. S. Williams.

Special committee No. 1 on review of

Manual sections reported on a number of changes which the committee had agreed upon. These included changes in brakeshoe standards, coupler specifications, standard dimensions for height of platforms and bumpers of interurban cars, additional information to the tables of wheels, provision for bolting pads to wheels to reduce noise in operation, location of end connections on cars and additional information regarding installation of connectors used on motor leads.

A tentative report on motor coaches was submitted by special committee No. 2, which reviewed the work of the 1926 and previous reports and included additional information which has been developed in co-operation with the Motor Coach Division of the Standards Committee of the Society of Automotive Engineers and other agencies. An inspection system for gasoline electric motor coaches as used by one large operator was submitted.

In the tentative report of special committee No. 3 on car equipment attention was given to improved design as incorporated in the new Springfield and Joliet cars and to advances made in streamline painting.

The report of special committee No. 4 on lighting contained a review of the principal conclusions as presented in the 1926 report and included revisions and additions for a more comprehensive treatment of the subject. A section on recommended practice contained a discussion of suitable lamps and reflectors for car lighting, together with illustrations of typical lighting units, and plans showing proposed arrangement of outlets. A table showing comparative demand for standard street railway lamps during the years 1925 and 1926, together with a review of recent developments in lamps for electric railway service, was given in an appendix of the report.

Special committee No. 6 on lubrication presented a tabulation of answers to a questionnaire which had been sent out. The report will be revised and put in standard form.

A complete report was presented by special committee No. 7 on air compressors. This will be sent out for letter ballot to the members of the committee.

Special committee No. 8 on motor brushes reported on a program which had been previously outlined. This is being carried out and a progress report will be presented this year.

Particular interest was shown in the report of special committee No. 9 on noise reduction. A number of tests have been conducted on various equipment parts to show how different types of installation can reduce noise.

Special committee No. 10 on gearing presented a tentative report with certain recommended changes in existing specifications.

Special committee No. 12 on journal boxes reported that recommendations would be made for doing away with thrust plates and omitting the lugs for holding these in journal boxes.

Special committee No. 13 on limits of wear is making substantial progress toward recommending limits of wear that will reduce the spreading of gear centers.

Special Rolling Stock Committee No. 1

SEVERAL important decisions regarding changes to standards and specifications as they now exist in the Manual were decided upon at a meeting of special rolling stock committee No. 1, held at association headquarters, New York City, June 6, 1927. Those present at the meeting were C. W. Squier, chairman; W. S. Adams, H. S. Williams, members of the committee, together with representatives of coupler manufacturers, H. E. Van Dorn, John Keegan, D. C. Davis, A. E. Heffelfinger, A. L. Price and H. W. Gilbert.

The morning session of the committee was devoted to a discussion of couplers. Revisions to the recommended specifications, serial No. E 100-12, were decided upon. In reviewing the specifications various comments from manufacturers were received. Those present felt that a large amount of work should be done in collecting additional information and developing standards for couplers. To develop them properly a special committee was recommended to be appointed consisting of various manufacturing representatives as well as operators of interurban railways.

New designs of brakeshoes were decided upon by the committee. They give more space in the grooved section of the shoe which fits over the wheel flange. This was considered desirable to provide for worn wheels.

Standard dimensions for heights of platforms and bumpers of interurban cars were discussed by the committee and certain changes were agreed upon. Changes in the specifications and tables for wheels were also agreed upon. It was recommended that a note be added to the effect that the hub diameters given in the tables should be looked upon merely as maximum limits to take care of eccentric bores. Specifications should govern the inspection and acceptance of wheels. To provide for bolting of pads to wheels to reduce noise in operation, the committee recommended that four holes be added to the present wheel design.

A new drawing for the location of end connections was presented. This will be included in the committee's final report. The miscellaneous method in practice on motor leads was reviewed and the committee recommended that more definite information be given regarding approved practices for insulating motor lead connectors. Several other specifications, which are now included in the Manual, were gone over and suggested changes were considered, but as additional information was required to give proper study, no changes were decided upon.

Way and Structures

REPORTS of nine special committees were read at the third meeting of the committee on way and structures, held at association headquarters, New York City, June 9 and 10. Subjects covered included review of existing standards, track ballast and drainage, rails, arc welding, special alloy steels other than manganese, effect of rubber-tired vehicles on pavement, bus garages, light grooved girder rail and standardization of switch tongues. Members present were H. H. George, chairman; A. T. Spencer, C. A. Smith, C. A. Alden, H. F. Merker, W. G. Hulbert, W. W. Wysor and C. F. Gailor, chairman of the special committee on arc welding.

Education

ON JUNE 14 an all-day session of the committee on education of the American Electric Railway Association was held. The program for the annual report was decided on and the work at the coming convention was discussed. Following the foremen conference demonstration of last year it is planned this year to conduct a six-day school, four hours each morning of convention week from Monday until Saturday inclusive, at which delegates from companies may receive instruction as to how to conduct foremen conferences. It was tentatively planned to have this group led by H. H. Norris of the Boston Elevated and A. J. Sarrė of the New Orleans Public Service, Inc., calling on Frank Cushman as an adviser, critic and instructor. Mr. Cushman, of the Federal Board for Vocational Training, Washington, D. C., is well known for his educational work in industry, with particular relation to the conference method of foreman training. Both Professor Norris and Mr. Sarrė have used this method on their respective properties for years. The work will be conducted alternately by these two men, holding several conferences each morning. At the close of each Mr. Cushman will criticise and make suggestions based on his observations.

Further data and application forms will soon be sent to member companies in order to enroll applicants for this training work in advance of the convention. In order to obtain the best results the group will be limited probably to 50 members.

The committee's report was essentially completed. It will contain a review of the educational activities of the member companies that have responded to the questionnaire sent out by the committee earlier in the spring.

At the meeting H. H. Norris presided for Edward Dana. Other members present were J. F. Hyatt, A. J. Sarrė, A. B. Gibson, H. H. Fenton representing W. H. Boyce, John A. Dewhurst and J. W. Welsh.

Traffic Congestion

WITH a few minor alterations the preliminary draft of the report of the committee on traffic and safety was unanimously approved by the members present at a meeting held at association headquarters June 9. It was decided to send a message of appreciation to C. H. Evenson, chairman, for the work he did in preparing the report. Members present were A. J. Fink, F. L. Butler, R. W. Emerson, J. P. Ingle, Deane Locke, J. A. Miller, Jr., E. C. Spring and Samuel Riddle of the Transportation and Traffic Association and H. K. Bennett, Seth W. Baldwin and A. G. Jack of the Claims Association.

The News of the Industry

Little Progress in Toledo

Prospects Not Bright for Settlement of Franchise Matter Before 1928 —Terms of Grant Unknown

Hope for the passage of a new franchise in Toledo to amend and correct defects in the present Milner service-at-cost plan to be put into effect before the beginning of 1928 is rapidly passing.

Representatives of the Henry L. Doherty & Company interests, including Frank R. Coates, president of the Toledo Edison Company and the Community Traction Company, Toledo; Dewey C. Bailey, special counsel, and R. E. Burger, chief of the utility division of Cities Service Company, have been in several meetings with the members of the street railway board of control in Toledo recently, but an agreement has not yet been announced and no franchise will be ready for submission at the August primaries.

The local political situation and the mayoralty election preclude submission at a general election and so the present plans would seem to contemplate the working out of the details of a new arrangement to submit to the voters at a special election late in November or early December.

Definite announcement of the terms of the new ordinance are not available, but the tenor of the conferees indicates that the new grant will provide the company with an exclusive franchise for bus and railway service for a period of ten years. The board of control is being asked for concessions by way of the writing off of the accumulated deficit of more than $1,000,000 and bringing in of probably $1,500,000 of new capital without increasing the outstanding securities of the Community Traction Company.

Work has started on the repair of the St. Clair Street tracks in the downtown section, forced upon the company by the city administration so that new paving could be laid on that street. Abandonment of these tracks was provided in the original Riggs plan. This move is taken to indicate that complete solution of existing problems is still many months away.

The City Council has also passed an ordinance which will give to private bus lines a two-year operating privilege, a move which some contend may block the city from granting exclusive transit privileges for two years. However, this ordinance has not been signed by Mayor Fred J. Mery and is not enforceable for some time. Its enforcement will be in the hands of the city administration, which is in accord with the negotiations being carried forward by the railway board of control.

It will be recalled that the franchise settlement ordinance, which was prepared by Dewey C. Bailey and Law Director Frank M. Dotson and received the approval of Prof. Henry Riggs and Attorney Newton D. Baker, was rejected by the board of control and a business men's committee of the Chamber of Commerce. That measure is considered definitely out of the picture in the solution of problems.

The power purchase question, which has been particularly knotty under the Milner ordinance, is believed to be solved on the basis of Professor Riggs' plan, but it will be put into effect only in the event of the solution of other franchise problems.

New Tariff in Buffalo

Ten-Cent Cash Fare in Buffalo Depends Upon Carrying Out Program of Reconstruction—Rate Base on Which Company Is Allowed Return Fixed at $23,261,558

THE Public Service Commission authorized the International Railway to file a new tariff of fares in Buffalo, N. Y., to be effective July 1, 1927, fixing the adult fares at 10 cents cash, three tokens or tickets for 25 cents and 3 cents for children's fares, between the ages of five and twelve years. The order of the commission is contingent upon the agreement of the company to carry out diligently and in good faith a reconstruction program, beginning with the reconstruction of tracks and repavement of Grant, Seneca, East Ferry and Smith Streets and Fillmore Avenue, the estimated cost of which is $947,703.

On Sept. 15, 1926, the International Railway proposed to increase fares in Buffalo to 10 cents for adults and 5 cents for children, to be effective Oct. 16. The commission refused to accept the new tariff and instituted an exhaustive investigation into fares, revenues and operations of the railway, inasmuch as complaint had been filed by the city with the commission as to service, condition of equipment, operation of one-man cars and condition of the roadbed. The city and company both filed exceptions to the report of the commission's accountants and very little further testimony was taken, so the questions are decided substantially on the records of the commission brought down to recent date by the reports of the accounting and engineering divisions of the commission.

The rate base arrived at by the commission, applying to the city of Buffalo only, and upon which the company is entitled to a return for investment, is $23,261,558. The estimated revenues and operating expenses, including taxes, for 1925, and on which the present fare is based, would have left available for return on investment $1,850,061. The increased fares authorized at that time, however, failed to produce the revenue estimated, the actual return for 1925 being $1,664,497. Failure to earn the estimated revenue was due to the decrease of passengers, which had been anticipated, but not to the extent occurring. There was some decrease in operating expenses.

The commission estimates that the increased fares now allowed will produce a net return of $1,961,144, with which the company should be able to pay interest on its funded debt and other fixed charges against its income, and with the application of at least part of the annual accrual to its reserve for depreciation should carry out the reconstruction program outlined.

Commissioner Pooley, who conducted the investigation for the commission, says in his memorandum:

> The city of Buffalo is vitally interested in its street railway transportation. A large amount of track reconstruction and repaving appears to be necessary now and in the near future. The projects demanded by the city and now imperative involve an expenditure on the part of the company of upward of $2,500,000 without taking into consideration construction work demanded every year.

In his statement accompanying the report he said it was unfortunate that fares in Buffalo had to be again increased. The commission was desirous of lending its co-operation for the betterment of the transit situation in Buffalo, and to that end would, upon request of the city authorities, arrange and conduct conferences between the city and company officials. It might be that certain improvements or extensions are contemplated or desired by the city and that its authorities may wish to give other street improvements priority over some of the projects covered by the commission's program. There should, too, be a further program for reconstruction and repavement, and the subject matter of the various court actions now pending might be considered and further useless and costly litigation avoided. All of these and other matters might well be discussed at the above suggested conference, which will be arranged by the commission promptly on receipt of advice that the city authorities desire to co-operate.

Improvements Carried on Apace in Milwaukee

Chief current activities in the transportation branch of the Milwaukee Electric Railway & Light Company, Milwaukee, Wis., are addressed to improving car and bus service within the metropolitan area and to transforming the company's old interurban lines into rapid transit, de luxe lines. The Waukesha - Oconomowoc - Watertown line, thus transformed last year, is popular and successful. Rapid transit de luxe car service on the Burlington-East Troy lines will be opened early in the summer of 1927. On completion of this plan, Milwaukee Electric will give Milwaukee, for the first time in the city's history, swift and luxurious suburban passenger service southwest and west on its own lines, and north along the lake shore on the Milwaukee Northern—a service which will be a large factor in promoting outward industrial and residential growth of the Greater Milwaukee district.

Aurora & Elgin Increases Efficiency of Freight Service

By the adoption of improved methods, the Chicago, Aurora & Elgin Railroad has brought about faster handling of carload freight traffic, affording substantial economies in operation, including a reduction in per diem costs for foreign line cars on its rails. Based on the experience of the first month's working of the new plan an annual saving of approximately $30,000 is estimated by company officials. The change from former practice was made on Feb. 1 last, when a car service section of the transportation department was established at Wheaton, Ill., at the instance of Col. Edward J. Blair, general manager.

Since that time the average number of car-miles a day has increased some 29 per cent, compared with a similar period of 1926, resulting in a more expeditious movement of carload freight and permitting more efficient utilization of existing facilities. The ratio of empty freight car-miles to total freight car-miles has been lowered from 56 per cent to 33 per cent, incidentally reducing proportionately the operating cost of handling cars in non-revenue movement.

Rates Changed in Houston

Ten-Cent Cash Fare, Token Fare and Nickel Pass to Meet All Demands—More than $1,000,000 to Be Spent for Improvements in Year

ADJUSTED rates for the Houston Electric Company, Houston, Tex., effective June 13, call for 10-cent cash fares, tokens four for 30 cents and the weekly "nickel pass," introduced first at Fort Worth several months ago. The change in rates is from a 7-cent fare with 6¼-cent token rate and 3⅜-cent token fare for children. The new rate for children will be 4 cents.

Improvements during the next twelve months are to cost $1,000,000. These include the purchase of new cars and buses.

"Ride more for less per ride" is becoming the new sales slogan of the traffic superintendent. For the person who rides the street cars twice a day the average cost will be 6.79 cents per trip, just a little less than the present cash fare and slightly higher than the present tokens.

When shown to operators of the Houston Electric Company the holder of the "nickel pass" will be entitled to ride on all equipment, including the express buses, for the payment of a 5-cent fare. The passes will be issued weekly and will sell for 25 cents. Issued on Sundays, the passes will become valid the following day. If purchased any day after Sunday, the price is to decline at the rate of 3 cents per day. Thus the rider who does not purchase his pass until Wednesday pays only 19 cents for it and may ride cars or buses for an additional 5 cents per trip. When the pass is used three times a day or 21 times per week the cost per ride will drop to 6.19, or less than the tokens; for four rides a day the average cost will be 5.89 cents, and for five times a day, or 35 times a week, 5.71 cents.

Manager Jeff L. Alexander petitioned the City Council on Feb. 28 for an adjustment in rates as the Houston Electric Company was about to fulfil certain promises made in a "citizens' agreement" four years ago, when jitneys were abolished by ordinance. During the life of the agreement the company co-ordinated its railway and bus service and made other improvements, the total cost having reached $1,650,000. In suggesting a 10-cent cash fare with 8⅓-cent tokens and 35 cents for the "nickel pass," the company compromised for the new rates. Lowering the initial cost of the pass, it is believed, is likely to cause too great a reduction in car fares, though the plan will be thoroughly tested. Mr. Alexander and other officials of the company hail the new plan as one which will prove popular with the most frequent customers, through lowering their fares, and giving the mass riders during the rush hours a reasonable rate which will justify such improvements as are needed. It is only the infrequent rider who must pay the 10-cent cash fare.

Collect-on-Delivery Service in Indiana

A new collect-on-delivery service between all agency stations of the Union Traction Company of Indiana become effective on May 25 as a feature of the company's merchants' dispatch express freight service. Heretofore shipments have been accepted only on straight billing with no provision for collection on delivery. The service, for the present, will be confined to agency stations on the traction lines, 68 in number, including the Indianapolis station.

Rehabilitation of Ohio Property to Be Commemorated

The Cincinnati, Hamilton & Dayton Railway, Dayton, Ohio, plans a private inspection, dinner and celebration on June 22 to commemorate the rehabilitation of the property of the company. In general the program is as follows:

Inspection of a portion of the property, using for the first time the new interurban equipment now under construction.

Inspection of a typical new power substation.

Inspection of the new car shops and offices at Moraine City.

Dinner at 6:30 p.m. at the company's new offices and car shops, Moraine City, immediately south of the Frigidaire plant.

Public cremation of old cars—the passing of the old; the advent of the new.

Fireworks display in conjunction with new and novel airplane night flying by the flying section of Wright Field, Dayton.

There will be in attendance at this community celebration of the rebirth of one of Ohio's leading interurban railways a selected group of prominent citizens of the Miami Valley as well as people prominent in New York, Philadelphia, Chicago, Pittsburgh and elsewhere.

Ten Cents Ordered in Albany on July 1

Car fares in Albany, N. Y., and the Capitol District are to be increased from 7 to 10 cents on July 1, by order of the Public Service Commission issued on June 15. The increase is effective on all lines of the United Traction Company serving, besides Albany, the cities of Troy, Cohoes, Watervliet and Rensselaer and the Villages of Green Island, Menands and Waterford. Under one provision of the ruling, however, the company must sell tokens at the rate of thirteen for $1. Fare for children, however, is increased from 3 to 5 cents. Transfer privileges are to remain as under the present tariff.

The decision of the commission in granting the increase was written by William A. Prendergast, Republican chairman, with three other commissioners concurring. Commissioner Lunn of Schenectady, Democrat, dissented.

No decision has been made in the case of the Capitol District Transportation Company, operating buses over streets in the same cities and which filed application before the commission for a 10-cent fare. The commission pointed out that the traction case decision was not to be construed as having any bearing on the decision rendered in the case of the bus company, a subsidiary of the United Traction Company.

In addition to awarding the increase asked by the traction company, the majority opinion refused to grant segregation of the company's properties, for which attorneys for the city of Albany had contended long and bitterly at hearings before the commission.

Two points of importance over which Mr. Lunn disagreed with the other four commissioners in the traction company case were valuation and segregation. Mr. Lunn held the traction company in arriving at a valuation basis of its property on which fares were to be determined "disregarded all elements that entered into the determination of valuation except that of replacement costs."

The only evidence presented, he said, was that of present reproductive cost of its entire property undepreciated.

Segregation of the company's properties as a basis for determining the rate of fare that should prevail in each city separately was considered of vital importance in the proceedings.

Wages Still an Issue in Toledo

Deadlock over the wage issue in the new contract which representatives of the Community Traction Company, Toledo, Ohio, and the union has held back a settlement for nearly two weeks. Every other point has been adjusted. The company has offered the men $5 a day minimum wage with $120 a month guaranteed to all extra men, with the old hourly wage scales in effect and some concessions on the part of the men as to working conditions.

The men want an increase of 10 cents an hour over the present scale of 50 cents for the first nine months, 52 cents for the next three months and 55 cents after the first year of service.

There has been considerable talk of a formal arbitration, but this would throw all conditions of the contract into the issue.

The old contract expired on May 31, but any changes which may be included in the new contract will be retroactive.

Philadelphia Subway Bids Will Be Opened July 19

Bids for extending the South Broad Street subway of the city of Philadelphia were called for June 10 by Henry E. Ehlers, Director of the City Transit Department, in whose office they will be opened on July 19. Unofficial estimates place the cost at $20,000,000. The specifications call for a continuation of traffic throughout the subway construction. Laying of rails, installation of electrical equipment and repaving of South Broad Street are not included in the construction contract. The length of the extension, known as Contract No. 109, is 3,020 ft. Transit department engineers estimate that there are 372,000 cu.yd. of excavation, 54,000 cu.yd. of concrete, 11,700,000 lb. of structural steel, 1,400,000 lb. of reinforcing steel and about 1,200 tons of cast-iron pipe included in the contract.

Property Owners and City Confer on Chicago Subway Problems

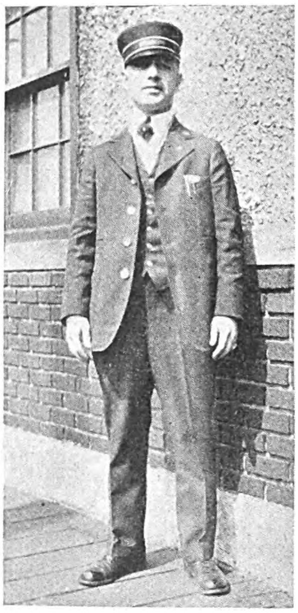
Downtown property owners and city officials of Chicago conferred for the first time a few days ago on the problem of subway construction. Addressing the meeting in behalf of the Lake Street Property Owners' Association and Wells Street District Property Owners' Association, H. L. Ressman, president of both organizations, offered renewed assurance to the city of their readiness to stand equitable special assessment for subways to be built wherever expert engineers should declare them most beneficial. In return for this support he asked that the city government pledge itself to remove the present sunlight-obscuring and noisy elevated structure from the Loop district as a part of the traction-subway program. The two associations represent approximately 80 per cent of the property owners on Lake Street and Wells Street in the downtown district.

While predicting the ultimate removal of the structure, Michael J. Faherty, president of the Local Board of Improvements, told the property owners that such a step would still be a bit premature and that they would have to consult with Samuel Insull, chairman of the Chicago Rapid Transit Company, which holds a 50-year franchise in the Loop, if they wanted the structure torn down.

With the co-operation of property owners thus assured, Mr. Faherty declared, the city would not be hindered by lawyers employed to attack the legality of spreading the cost of building the tubes between themselves and the city as a whole. The absence of legislation authorizing subway construction by special assessment, he added, is the only thing that is delaying the actual work. Traction bill No. 1, now awaiting action in the General Assembly at Springfield, is designed to give the city full authority in this matter.

Employees of South Shore Line Win Better Business Prizes

Cash awards totaling $300 have been received by twenty employees of all departments of the Chicago, South Shore & South Bend Railroad for their successful efforts in obtaining new business for the company during the first 60 days of the current year. The initial prize winners in the company's better business campaign, which was launched early in January, were picked from those showing the greatest efforts and results as represented in the number of revenue-producing tips turned in to the traffic department. During the first three months of this year 150 employees, or 25 per cent of all who are eligible, sent in one or more tips. The total number of tips received exceeded 1,280. Prizes totaling $300 will be awarded every 60 days throughout the year.



Charles Derrico, winner of $100 prize in South Shore's better-business campaign

Business gained through this campaign, according to the committee on awards, showed very favorable totals and as the campaign continues even greater results are anticipated.

Recapture of New York City Lines Discussed

James L. Quackenbush, general counsel for the Interborough, and former Gov. Nathan I. Miller, special counsel for the Brooklyn-Manhattan Transit Corporation, will be furnished with maps and other data showing in detail the tentative plan for a new city-owned subway system prepared by Col. William C. Lancaster, chief engineer of the State Transit Commission, and submitted at the transit readjustment hearing of the commission on June 10.

This tentative plan provides a system formed by a combination of the subways now under construction and contemplated, and the recapturable lines of the Interborough and B.-M.T. The series of maps presented by Col. Lancaster showed a subway system of 146 road miles which he said would form a complete system. He said it contemplated the recapture of all the B.-M.T. subways and the West End elevated extension, and the east side subway and the Interborough's Queens extension.

The plan contemplates an expenditure of $178,000,000 for recapture purposes—$52,728,000 for the desired portions of the B.-M. T. and $126,000,000 for the east side branch of the Interborough and its extensions to Queens.

Mr. Lancaster testified such a merger would produce a "very complete system," extending into all boroughs except Richmond.

While it was made plain that the commission has not in any sense approved this proposition as a whole, it became increasingly apparent that any plan is almost certain to include recapture of certain properties as a feature. The lines recaptured probably will be determined eventually by the attitude of the companies.

It was testified the B.-M.T., including equipment, has expended $49,232,000 on development of its subways, and that its deficit on its investment had been about $16,000,000, including its preferential of $3,500,000 a year. Including elevated extensions and third tracking, the whole investment under Contract No. 3 was brought up to $89,000,000. F. W. Lindars, accountant for the commission, said it would cost only $67,000,000 to recapture all those portions which can be taken back under the contract. The city's deficit on the B.-M.T.—loss of interest and sinking fund—Mr. Lindars figured at $47,000,000, bringing the total city investment in the road to $214,500,000.

The Interborough situation is different. The city's investment under Contracts 1, 2 and 3 totals $176,000,000, while the company, including cost of elevated extensions and third tracking, has chipped in $210,710,000. One curious thing brought out was that under the Interborough contracts the elevated extensions and third tracking are recapturable, but the road cannot be operated by the city.

Mr. Lancaster testified lines now being constructed by the city plus the portions proposed for recapture of both the private lines would provide a system with 146 road miles, leaving the Interborough with 71, and that the new system would be 27 miles longer than the combined systems, which would be left with only 119 miles between them.

"Carhouse" Cars Carry Passengers in Cincinnati

The unpopular "Barn Only" sign has been abandoned by the Cincinnati Street Railway, Cincinnati, Ohio, and plates lettered "Hyde Park Carhouse" or lettered for other carhouses have been substituted. This change has a psychological advantage. When a prospective car rider sees a "Barn Only" sign on the front of an approaching car he steps back, feeling that the car is out of service, when actually it will take passengers to any point up to the carhouse. With the new method, persons whose destinations are anterior to the carhouse will feel free to board those cars. The practice of using these cars has also been stimulated by notices through the press to the effect that carhouse cars will carry passengers at all times. An additional feature of these signs is that they are painted on the reverse side of the regular route number plates. All cars assigned trip numbers from a given carhouse will return to that carhouse at the end of the run. By this system one more sign is eliminated from the front of cars.

Mitten Building Replaces Equitable Building in Philadelphia

Mitten Management has purchased the Equitable Building, at the northwest corner of Broad and Locust Streets, Philadelphia, Pa. The total cost of the building was approximately $6,000,000, of which $4,300,000 is well placed on mortgage at a low rate of interest.

The Equitable Building will, in the future, be known as Mitten Building, and in addition to housing all of the Philadelphia Rapid Transit Company's office activities will also house the industrial section of the B. of L. E.-Mitten Bank, of which the principal office is at Market Street and West City Hall Square. Mitten Bank Securities Corporation will also have its headquarters in this building, at which point its executive vice-president, W. K. Myers, will be located, as also will the general offices of Mitten Management. Inc.

Another Piedmont & Northern Hearing June 20

Permission to intervene and become a party to the proceedings of the Interstate Commerce Commission in the matter of the application of the Piedmont & Northern Railway for a certificate of convenience and necessity to complete the proposed extensions of the lines in North Carolina and South Carolina has been asked by Gov. John C. Richards, the South Carolina Railroad Commission and Attorney-General John M. Daniel. They feel the establishment of the additional service is required by public necessity.

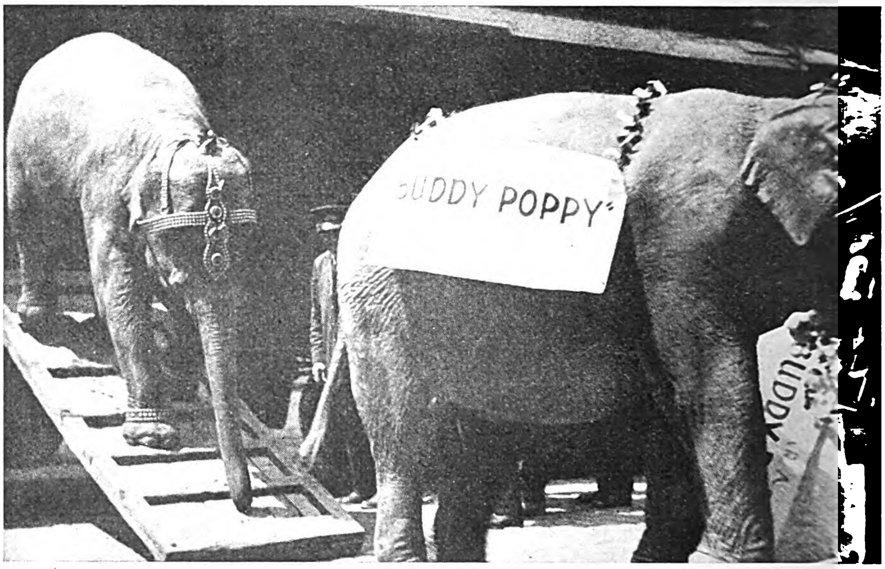
The Interstate Commerce Commission has ruled that it had jurisdiction over the Piedmont & Northern line and the petition for permission to construct the extensions now is in the hands of the commission.

The Southern Railway and the Seaboard Air Line Railway are opposing the construction of the new line. The lines proposed from Spartanburg to Gastonia and from Charlotte to Winston-Salem parallel the Southern Railway most of the way.

The question of the authority of the Interstate Commerce Commission over the Piedmont & Northern will be one of the matters to be heard on June 20.

A New Wrinkle! In Fact, Several of Them!

Ever alert to opportunities for civic help, the Pittsburgh Railways, Pittsburgh, Pa., received quite a bit of publicity during the latter part of May when the company hauled three young but husky elephants from their apartment at Kennywood Park (Pittsburgh's largest amusement park, about 10 miles from the city) down to the business section of Pittsburgh, where they were put through various stunts by their trainers in front of the railway company's office building.



Parade of pachyderms at Pittsburgh promotes purchase of poppies

The occasion was "Poppy Day," held throughout the Pittsburgh district by the Veterans of Foreign Wars. In order to stimulate the sale of poppies and to advertise the park, the Kennywood management offered the elephants for display on Saturday morning.

The railway helped out by furnishing a freight car for free transportation between the park and the city.

Additional Authority for Dr. H. E. Fisher

Standardization of employee medical service on the four electrically operated railroads in the Chicago district under the management of Samuel Insull and associates was announced with the recent appointment of Dr. Hart E. Fisher as chief surgeon of the Chicago, Aurora & Elgin Railroad and Chicago, South Shore & South Bend Railroad. Dr. Fisher has been in charge of the medical department of the Chicago Rapid Transit Company, Chicago, North Shore & Milwaukee Railroad and Public Service Company of Northern Illinois for several years.

Zero Hour a Success

Trainmen of the Georgia Power Company, Atlanta, Ga., have completed a series of eighteen "zero hours" over a period of as many days without an accident. With 400 street cars and 1,200 trainmen employed, only one accident was reported, and that was an automobile accident not affecting the street car. The drive started on May 9, when "zero hour" was set at from 6 until 7 o'clock in the morning. Thereafter "zero hour" moved up one hour each day until the conclusion of the safety campaign on May 26, when it came from 11 to 12 o'clock in the evening. Each day notices were posted at every carhouse giving the time of "zero hour." Similar notices were posted in all of the cars of the company, so that every employee knew when the hour came each day. The city safety council and other agencies co-operated in informing the public on "zero hours."

No Lower Fare for Boston & Worcester Railway

The State Department of Public Utilities of Massachusetts has dismissed the petition of the patrons of the Boston & Worcester Street Railway for a lower fare. The road is now selling zone tickets allowing 66 rides for $2.50, and the department suggests that the receiver for the company might well issue tickets for 26 rides for $1 to obviate the necessity of patrons tying up a large amount in tickets, but declined to order him to do so. In the order, the department states:

> It appears that the railway, since the receivership, has been operating at a deficit and that the increases in fares were made in the hope of cutting down the deficit. A receiver is ordinarily appointed to the interest of creditors. He is an officer of the court and his acts are subject to the control of the court. We are of the opinion that we have jurisdiction to order reduction in rates established by a receiver where they are manifestly unreasonable. It ought, however, to be a very plain case to justify such action on our part. Such is not the situation in the fares complained of.
>
> We think the receiver might well consider the advisability of issuing tickets good for 26 rides for $1.

New York Mayors Discuss Paving, Bus Regulation, Traffic Control

The New York Electric Railway Association through its secretary, William F. Stanton, asked the New York State Conference of Mayors at its eighteenth annual gathering in Niagara Falls to appoint a special committee to meet with a similar committee from the association in an effort to come to an understanding over paving between tracks. As a result it has been agreed to meet representatives of the railways at some future time and discuss the form legislation should take. Mayor Samuel A. Carlson, Jamestown, president of the conference, will hear any suggestions the railways may advance in respect to changes in the law and later in the year a special committee will be appointed to discuss the problem in greater detail.

William P. Capes, secretary of the conference, indicated that no concessions would be made which would be to the disadvantage of the cities or the taxpayers. The railways are seeking a change in the law which would obligate them to repave only those portions which, it could be proved, have broken down under railway traffic.

Motor bus regulation presented another topic for discussion at the Niagara Falls conference. Mayor Carlson said state laws are inadequate and that lack of governing power is producing a very unsatisfactory situation. The association went on record in favor of instituting a study of bus regulation in co-operation with the New York State Public Service Commission and the New York Electric Railway Association. Another recommendation was enactment of an amendment to the general highway law to provide uniform traffic regulations by control signals.

Mayor Walker of New York urged the Mayors to support the $300,000,000 debt limit extension for credit for subway building in New York City by encouraging the voters of their cities to cast their ballots in favor of the debt limit amendment. According to Mayor Walker the purpose of the amendment is to provide that whatever sum, up to $300,000,000, the New York City authorities decide to expend for the construction of new subways shall not be included in calculating the debt limit of the city. In other words, it provides that the credit of the city of New York, in the development of its transit facilities, shall be extended in the sum of $300,000,000.

San Francisco Extensions Fail to Carry

San Francisco voters at a special bond election on June 14 refused to approve two municipal ownership measures. The proposals were to buy the privately owned Spring Valley Water system for $40,000,000 and to spend $4,700,000 for municipal railway extensions. They failed to receive the necessary two-thirds vote. Friends of the two measures blame the light vote for their defeat. Out of a total registration of 225,000 only 73,117 went to the polls. The vote recorded on the railway bond issue was 44,305 yes votes and 28,888 no votes. The proposal to build the Bernal cut carried. This is a surface tunnel in the Mission district, linking that district with the new Excelsior district, now served by the Market Street Railway. Use of this cut is desired by the Municipal Railway.

New Texas Road to Open

Passenger service over the new Houston North Shore Railway between Houston and Goose Creek, Tex., is announced to begin on June 19. The line is 32.5 miles long and penetrates territory hitherto without rail facilities. Control of the road is understood now to lodge with the Missouri Pacific Railroad. Power for operation will be supplied by the Houston Electric Company.

Owen D. Young Heads Delegation to Stockholm

Owen D. Young, chairman of the board of the General Electric Company, will be the chairman of the American delegation to the Stockholm meeting of the International Chamber of Commerce, June 27 to July 2, it was announced recently by the American section. The American delegation will be made up of more than 150 leading business executives, representing different lines of industry, finance and commerce.

The conference will be in session six days, during which time the delegates will endeavor to work out a solution of some of the problems which are retarding the development of international commerce. For the purpose of technical discussion, the meeting will be split into four groups: Finance, Trade Barriers, Industry and Trade, and Transportation and Communications. The American participation in each group will be under the general direction of a committee of the American delegation.

Sightseeing in Portland.—A recent number of *Watts Watts*, the house organ which the Portland Electric Power Company, Portland, Ore., distributes through pockets on the street cars, is a tourist number containing information on places to go in the vicinity reached by the street cars. This company runs two sightseeing cars each day during the summer, touching all interesting points in the city. The fare is 50 cents and the trip consumes about 1½ hours.

Municipal Control Sought.—Bakersfield, Cal., may join the ranks of cities having municipal control over transportation system, if plans of the Bakersfield Realty Board are carried out. Action was taken recently at a meeting in a move to have the city take over control of the Bakersfield & Kern Electric Railway. Sentiment in favor of the municipal control idea followed the failure by the Realty Board to induce the railroad to extend its line into the southern part of the city, territory the railway considered unprofitable.

Verdict Won by Traction Company.—An award of $400 was made to the Morris County Traction Company, Morristown, N. J., on June 7 in its suit against the Dispatch Motor Express Company of Newark. The suit resulted from an accident in Main Street, Rockaway, when a truck of the Dispatch Motor Express Company crashed into a trolley car. This is the third verdict recovered by the Morris County Traction Company during this term of court, two verdicts for damages to its equipment by autos having been secured previously. In addition to these verdicts the company has collected damages in seventeen cases where the cars and autos were in collision during the first six months of 1927. The judge remarked to the jury in the last case that a railway should receive the same consideration in a case as if an individual were suing the company.

Seeks Fare Increase.—The Central California Traction Company has applied to the Railroad Commission for permission to increase its local fare in the city of Sacramento, Cal., from 5 cents to 7 cents per passenger.

Northwestern University Gives Summer Public Utility Courses. — The Northwestern University School of Commerce, in Chicago, announces that it will, as heretofore, offer two courses of instruction in public utilities during the summer session of 1927. These courses will afford an opportunity for a full program of work for those interested. The course in principles of public utilities will be offered by Prof. James P. Adams of Brown University and the graduate seminar will be under the direction of Prof. H. B. Dorau. Northwestern University School of Commerce during the regular school year offers a large number of courses, both graduate and undergraduate, dealing with every aspect of the public service industries.

Reduced Tickets for Sale. — The Springfield Street Railway, Springfield, Mass., placed in operation on June 5 a reduced rate round-trip ticket selling for 30 cents between Springfield and Riverside Park, good on the cars and buses to and from the park. However, no transfers are issued or accepted on the buses. The tickets are effective up to and including Sept. 10. Tickets will be sold by conductors and operators only on the cars or buses.

Theater Makes Refund.—For the week of June 6 patrons of the Nashville Railway & Light Company, Nashville, Tenn., were offered free rides by the Capitol Theater management. Introducing this offer a few weeks before, the theater gave round-trip carfare to hundreds of persons who visited the playhouse. All the patrons had to do was to present a coupon to the box office of the Capitol Theater when the theater tickets were bought and the 14-cent refunds were made.

Ten Cents Until 1931.—The Public Service Commission on June 9 granted the application of the Plattsburg Traction Company, extending the time to May 29, 1931, during which the company is authorized to charge 10 cents for the transportation of passengers within the city of Plattsburg, N. Y. On May 29, 1926, the Common Council of the city of Plattsburg authorized the company to charge a 10-cent fare for a period of five years. Application was made to the commission for approval of this fare and the commission granted such approval to remain in effect until June 4, 1927. The company then asked for a further extension in accordance with the action of the city officials. The commission was satisfied that such fare was just and reasonable.

Special Rates in Oregon.—The Oregon Electric Railway has been making special rates for the military tournaments and commencement festivities at the colleges and universities along its Willamette Valley line, in Oregon. Round-trip tickets were sold at the rate of about $3.70 for 100 miles, between Portland and way points.

Changes Awaited in Birmingham.—Railway rerouting and other traffic changes recommended by Ross W. Harris, following a traffic survey of Birmingham, Ala., will probably go into effect on June 26. J. S. Pevear, vice-president and general manager of the Birmingham Electric Company, said the company expects to have the track changes completed and to be ready to put the rerouting into effect on that day. Work of making the track changes will cost approximately $100,000. The Alabama Public Service Commission held that the City Commission had ample authority under the police powers of the city to require the rerouting as recommended in the survey. That body dismissed a petition of the company for right to make the changes on the ground that there was no question of service involved and that the commission was without jurisdiction.

Discourages Railway Resumption.—With the transportation problem in Columbia, S. C., rapidly becoming more aggravated, members of the Columbia City Council have asked R. L. Peterman, vice-president of the Broad River Power Company, which formerly operated cars in Columbia, about the possibility of resuming railway service. In reply to a question from the Mayor of Columbia, Mr. Peterman said he saw "no hope at all" for the resumption of service. He expressed the belief that railway service could not be made to pay and that street cars as a mode of public transportation were gradually being abandoned. Mr. Peterman, however, said he would take the matter up with higher officials of his company.

Opposes Fare Rise.—Declaring that the "time is inopportune" for the Georgia Public Service Commission to approve an increase in the Atlanta, Ga., fares, the Brookhaven Chamber of Commerce, the Morningside City League and the citizens of Oakland City—all suburbs served by the Atlanta system—have filed protests with the commission against the proposal of the Georgia Power Company to increase fares. July 12 has been set as the date for hearing. Several days ago the Georgia Power Company filed a petition with the Georgia Public Service Commission asking permission to increase present cash fares in Atlanta from 7 cents to 10 cents, as well as to increase price of tickets from three for 20 cents to three for 25 cents. It was alleged by the company that the railway division, instead of earning the 8 per cent on its investment authorized by the commission, was failing to reach this figure by approximately $1,000,000.

Recent Bus Developments

Interurban in Michigan Secures Operating Rights

Will Start Six Buses to Compete with Present Services to Michigan Shore Resorts

The Michigan Public Utilities Commission announced in an order issued on June 15 its decision authorizing the Grand Rapids, Grand Haven & Muskegon Railway to operate buses in conjunction with the company's electric cars between Grand Rapids and Muskegon and Grand Rapids and Grand Haven. For more than a year the officials of the company have sought to secure this right against the pooled interests of individual or syndicated bus lines that parallel the railway. President S. L. Vaughan, announces that buses will start the service on July 1.

The awarding of the franchise establishes a precedent in Michigan in that the territory involved now is served by another bus line. It was the last official act of the commission before two of its members retired to make way for two new members appointed to the body by Governor Green. Commissioners Odell, Duff and Doyle signed the order. Commissioner Pepper refused his signature. Commissioner Handy was absent from the board, having resigned on June 11.

The three commissioners said they acted after representatives of the bondholders testified the road would be abandoned unless bus service was permitted. Their order was an attempt to prevent the railway from going the way of the Grand Rapids, Holland & Chicago Company, recently defunct.

Officials of the interurban met on June 15, arranged a tentative schedule for the new buses and announced an hourly service both ways after 9 a.m. The electric cars will be operated morning, noon and night to accommodate persons who reside in nearby cities and work in Grand Rapids. Limited trains will continue to connect with the boats from Grand Haven and Muskegon to Milwaukee and Chicago. Freight car service will not be affected by the bus service.

To help popularize the bus service, hand baggage will be carried on the buses, while trunks, sample cases and other luggage too large for the buses will be transported in a combination freight and passenger car run on the interurban at noon.

The company will start its new service with six buses of the latest type, painted tangerine and trimmed in black to correspond with the interurban cars. They will be known as the Lake Line Motor Coaches.

Two sets of terminals will be established in Grand Rapids and Muskegon and in Fruitport and Grand Haven under this double interurban and bus plan, with the bus line junction at the present interurban station at Spring Lake. The line running from Fruitport and hugging the shore of Spring Lake to the village of Spring Lake and thence to Grand Haven will service many small resorts and open up a route hitherto without public transportation accommodations.

Mr. Vaughan says his company plans to charter buses to be run to any part of the state. After July 1 through buses will be run from Grand Rapids to Grand Haven to serve vacationists at the various resorts.

Mr. Vaughan hopes the new service will permit his company, now in receivership, to be brought back to a paying basis. Revenues taken from the railway by the competing bus lines are large during the summer tourist season.

I.C.C. Working on Bus Report

The Interstate Commerce Commission expects to complete its report on the operation of buses and motor trucks by, or in connection or competition with, common carriers subject to the interstate commerce act in time to submit it to Congress at the opening of the regular session. John J. Esch, chairman of the commission, so stated orally on June 11.

The investigation was ordered by the commission on its own motion on May 21, 1926. The scope of the investigation includes "the legality and propriety of the arrangements under which buses and trucks are operated; the rates, fares and charges for such services, and the provisions for filing schedules thereof, and the extent to which the traffic and revenue of carriers subject to the act are affected by the operation of motor buses and trucks."

Bus Feeders to Be Installed by Chicago Surface Lines

The Chicago Surface Lines is about to enter the bus field. In anticipation of the development of a number of coach lines in the near future, a separate motor coach organization has been established and all bus operation and maintenance will be under the direction of Walter Becker, assistant superintendent of the utility department. Temporary headquarters will be at the carhouse at Grand and Leavitt Streets, which has been remodeled for this purpose. The management has recognized for some years the value of motor coaches as feeders to the street car service, but opposition presented by the Chicago Motor Coach Company delayed the matter before the Illinois Commerce Commission for some time.

Five buses for this purpose are now being manufactured by the Twin Coach Corporation, Kent, Ohio, and delivery is expected in the latter part of June. Following that they will be put into service on Diversey Avenue from Crawford Avenue to Laramie Avenue, a distance of 1½ miles. This is the new Fageol type of bus referred to previously in the ELECTRIC RAILWAY JOUR-

NAL. It will seat 40 passengers and will be painted Para red and cream, the new standard colors of surface lines cars. The new coaches are for one-man operation. The operators will wear a type of uniform different from that of the street car men. The color is tan-gray, the coats of the Norfolk type with breaches and puttees.

Notices have been posted at all carhouses so that present employees may apply for this service and, if possible, the new group of operators will be selected from the present force of trainmen.

The rate of fare will be 7 cents with free transfers to connecting lines, the same as on the street cars.

Another Bus Line for San Diego Railway

Lloyd's El Cajon stage line, operating buses between San Diego and El Cajon, by way of La Mesa, has been sold to the San Diego Electric Railway, San Diego, Cal. The price paid was not made public. The sale involves the franchise and the equipment, consisting of two modern buses. The actual transfer of the franchise and property will be made as soon as authorization is secured from the State Railroad Commission.

It is understood the railway will operate the bus line as an auxiliary to its railway from the eastern terminus of the electric line through La Mesa to El Cajon. The railway has two applications before the Railroad Commission at the present time, requesting permission to operate lines on the routes affected. They are from 56th Street, on El Cajon Avenue, to La Mesa, and also from 34th Street, on Imperial Avenue, to La Mesa, by way of Encanto.

Abandonment in Indiana Sought

The Evansville & Ohio Valley Railway, Evansville, Ind., recently asked the Indiana Public Service Commission for permission to abandon its interurban line between Evansville and Mount Vernon. In the petition the company declares it will provide for a number of passenger and freight vehicles sufficient to accommodate a volume of business equal to that which it now has.

Improved roads were blamed by the company for its inability to operate between the towns at a profit. In its petition the company points out that the Indiana State Highway now extends from the city limits of Evansville to the city limits of Mount Vernon, running almost parallel with the railway line; that the highway is now in the course of construction and is being paved the entire distance between the two cities. It sets forth that when the highway is completed it will be unable to operate between the two cities except at a great loss.

The petition promises no increase in the present rates for either passengers or freight. The present fare schedule is based on 3 cents a mile, with a minimum fare of 10 cents. The Mount Vernon line has been operated since 1905. The Evansville & Ohio Valley assumed control in 1918.

New Agreement in Miami

The bus contract between the city of Miami and the Miami Beach Railway, Miami, Fla., has been canceled by agreement between the City Commission and company officials. A new agreement takes its place. Under it the city is relieved of the payment of about $1,000,000, including the cost of the buses and equipment, and is further relieved of reimbursing the railway for an operating deficit covering a guarantee by the city to meet the actual cost of operating the buses. The operating deficit, as shown by the company's books, is $369,499, although the city held an audit would show it to be less.

The new agreement extends to July 16, 1954. If it should be canceled by the city or the courts, the old contract is reinstated and the city is obligated to pay the sums due the company as of present date only.

In the new agreement the city waives the annual rental now being received by the company for the use of its railway. This amount averages less than $5,000 a year until 1929, when it was subject to revision for succeeding years. On the other hand, the city is relieved of purchasing new cars as was required in the railway agreement.

The agreement provides that if the city fails reasonably to regulate the transportation business as a whole in such manner as to permit the company properly to protect its revenues, investments and present operations, the agreement is canceled automatically. Both city and company officials declared that the new agreement would not affect the status or operation of other bus companies.

J. H. Gill, vice-president and general manager of the Florida Power & Light Company, indicated that public policy had a bearing on the company's decision to waive its claims. He said:

> The Florida Power & Light Company has investments in Florida totaling approximately $121,000,000, the safety of which, in the final analysis, is dependent upon the public and the public's attitude toward the company. With respect to this bus contract the company feels that it can better afford to waive $1,000,000 than to have the public assume that the company is being unduly benefited under any contract. The Florida Power & Light Company is and has been willing at all times to bring its problems before the court of public opinion in the belief that it will receive a fair answer from the people.

Meanwhile the final hearing of the jitney bus drivers' petition for an injunction to prevent the city from enforcing an ordinance that would keep them out of the business district of the city had been continued until June 10 to enable attorneys for the Miami Beach Railway, recently named codefendant in the action, to prepare their case.

Details of Regulation Discussed by Nebraska Commission

Thirty-five operators of intertown bus lines were represented in conference with the State Railway Commission on June 8 at Lincoln, Neb., to discuss future regulation and supervision of the business, to be taken over by the commission by virtue of a law that becomes effective on July 24. The conference developed that most of the companies wrote off their buses in four years, while one does it in three years.

The new law does not authorize the commission to fix rates or to issue certificates of convenience or necessity, but it does authorize the state body to supervise schedules and to prohibit any being used that are not approved.

The matter of insurance was warmly debated. The commission desires to increase the amount for the death or injury of one person from $5,000 to $7,000, with a total coverage of $30,000 for one accident. Another meeting will be held with insurance agents as advisers. They were not prepared to say that the new rules would decrease hazards sufficiently to influence rates downward. Another matter considered is a uniform system of accounts.

Violation of Operating Agreement Charged

The California Railroad Commission has directed the Western Motor Transport Company to cease immediately the transportation of passengers between North Vallejo and King, Napa, Flosda, Napa Junction, Sacramento Junction, Soscal and Napa Hospital in California following the filing of a complaint by the San Francisco, Napa & Calistoga Railway, which alleges that the bus company was carrying local passengers in violation of the terms of its operative rights granted by the commission. The defendant company was directed to cancel all rates applicable to such illegal service and through its successor in interest, the Dunham Stage Lines, to cease the transportation of passengers between Napa and King and between Napa and North Vallejo and to cancel its rates now on file for such service conducted jointly with the California Transit Company.

Buses Operating Over Former Railway Route.—Bus service was started by the Worcester Consolidated Street Railway, Worcester, Mass., on the recently abandoned railway route between Worcester and Webster, Mass., on June 1. It is planned to operate buses on express schedule to the Auburn and Oxford town lines. Transfers will be issued to passengers for use on all railway and bus lines of the company at connecting points.

Buses Succeed Cars.—An order was issued by the Illinois Commerce Commission granting the Tri-City Railway permission to remove its tracks and suspend service on the Stephens Park line, Moline, Ill. At the same time a certificate of convenience and necessity was granted to operate buses over the route from Fourth Avenue and Thirteenth Street to 37th Avenue and Seventh Street, Moline.

Pittsburgh Via the Gray Line.—A ten-page conveniently folded booklet has been issued by the Pittsburgh Motor Coach Company, subsidiary of the Pittsburgh Railways, Pittsburgh, Pa., intended to induce its patrons to see the steel and electrical city by means of the Gray Line, under which trade name the company operates. There are tours daily and on Sundays and holidays. They cover all points of interest in the city and suburbs.

Financial and Corporate

Costs of Connecticut Company Increase

An improvement over 1925 was the result of operations by the New York, New Haven & Hartford Company in 1926. This was the comment of E. J. Pearson, president, in the 55th statement of the affairs of the company addressed to the stockholders. The volume of freight traffic was the heaviest in the history of the company.

The net income of the Connecticut Company, one of the largest subsidiaries, shows a decrease in 1926 compared with 1925. Operating revenues increased principally from bus operation, while rail revenues decreased, due largely to the substitution of bus operation in December, 1925, for rail operation between Norwich and North Grosvenordale. Operating expenses increased principally on account of heavy cost of snow removal in February and December, 1926, and to increased rates of pay granted car and bus operators and shopmen, which was partially offset by increased economies. Taxes also increased, principally those paid the federal government.

On the lines of the New York, Westchester & Boston Railway 11,686,022 passengers were carried during the year, an increase of 1,531,823, or more than 15 per cent. An extension of the road from Larchmont to Mamaroneck, a distance of 1.79 miles, was opened for business on March 21, 1926. The number of passengers handled during the year at the two stations on the new extension was 526,051. A new station was constructed and opened for business on Nov. 7, 1926, on the White Plains Branch at Ridgeway. Extension of the road to Harrison, a distance of 1.70 road miles, is under construction and will be opened for business about June 1, 1927. There will be two stations on this extension.

The accompanying table shows the income account of the electric railway properties of the New York, New Haven & Hartford Railroad in 1926 compared with 1925.

An interesting reference is made in the report to the law enacted by the Legislature permitting the New Haven road to take over the securities of the New England Investment & Security Company, which owns the Springfield Street Railway and the Worcester Consolidated Street Railway. The New Haven company reiterates its faith in the electric railway industry. It states the company "is proceeding to rehabilitate the Worcester and Springfield properties in the hope that by placing them upon a profitable basis it may realize the whole or at least the greater part of the above investments." The company says that there seems to be no reason why, with up-to-date facilities, the railways in Worcester and Springfield might not materially increase their revenues and decrease their expenses.

U. G. I. After Day & Zimmermann

Utility Holding Company Arranges to Take Over Engineering and Management Organization—Engineers to Continue Active in Management of Utility Properties

The United Gas Improvement Company, Philadelphia, has obtained a controlling interest in Day & Zimmermann, Inc., Philadelphia, subject to the approval of the stockholders.

Arthur W. Thompson, president of the United Gas Improvement Company, says the business of the firm of Day & Zimmermann, Inc., will continue under the direction of Messrs. Day and Zimmermann. According to Mr. Thompson, the transaction is in line with the U.G.I. policy to extend its activities in co-ordinated public utility management, engineering and construction, as well as to acquire financial interest in such properties as may offer opportunities for consolidations and development of benefit to the public and investors. He said:

> The United Gas Improvement Company, with the rapid growth of its subsidiary companies and its extensive interest in associated properties, is fortunate in supplementing its holdings and personnel with an organization of such high standing as that of Day & Zimmermann, Inc., as the extent to which pressing needs for constructive public utility and industrial development and management can be undertaken is limited by the available supply of qualified executives and assistants to assume such responsibilities.
>
> There is much to be done in this field of endeavor which will react to the benefit of the public generally as well as customers and investors such as should result from effective supervision, co-ordination and the advantages of economic expansion plans.
>
> There will be no change in the method of conducting the business of the firm, which will continue under the direction of Messrs. Day and Zimmermann and their capable associates and organizations, as their leadership will undoubtedly produce results in the future as gratifying as have been their achievements in the past.

Day & Zimmermann, Inc., are engaged in the general business of engineering and construction, special investigations, appraisals and reports, and management of public utilities and industrial enterprises.

The work of their investigations and reports department has covered all branches of public utilities and a wide variety of industries in every state in the Union and in South America and Europe. In connection with this work an office is maintained in Paris. The clients served by this department include many of the foremost bankers of the country as well as the largest public utilities and industrial organization.

The engineering and construction division has had a diversified and valuable experience in the planning and

construction of industrial plants, public utility properties, piers, bridges, and recently has been active in the construction of hotels, hospitals, etc.

The prospective purchaser explains that the public utility management bureau has been doing an unusually constructive service for many years in the upbuilding of properties along sound lines, looking toward the rendering of the best service to the public and the holders of the various securities. From the commencement of these operations, fifteen or more years ago, every effort has been made to place the administration and operation of the properties on the highest possible plane comparable with the best that has been accomplished in the industrial field, in this way assuring not only the most efficient operation and safety of investment but the fullest measure of co-operation with regulatory bodies.

Among the properties at present under the management of Day & Zimmermann are:

The National Public Service Company, a holding company, which through its subsidiaries in New Jersey, Pennsylvania, Delaware, Maryland, Virginia, North Carolina, Georgia and Florida, furnishes electric light and power, gas, steam and electric railway, bus, ice and water service to 874 communities with a population of 2,139,000 and consolidated gross earnings of $27,788,000.

The General Public Utilities Company, which furnishes directly or through its subsidiaries electric light, ice and water to sixty towns in the States of Florida, Louisiana, Texas, New Mexico, Arizona and South Dakota, with an aggregate population of about 200,000 and gross earnings of $4,055,000.

The Southern Ohio Public Service Company, which is an operating company serving the city of Zanesville, Ohio, with electric light and power and street railway and a bus or interurban system, with a population of about 30,000 and gross earnings of $1,546,800.

One of the first properties organized by Day & Zimmermann, Inc., was the Penn Central Light & Power Company, which was recently acquired by the Insull interests.

Following the original announcement about the deal, it was made plain that the controlling interest in Day & Zimmermann, Inc., will be obtained by the United Gas Improvement Company through an exchange of securities. Stockholders of that company will be called upon to meet in the autumn to pass upon the plan to issue the amount of U.G.I. stock necessary to fulfill the terms of the transaction. Mr. Thompson said:

> We wish to emphasize the fact that Day & Zimmermann, Inc., will continue to be very active in the management and operation of the various properties which have been so successful under their direction. This transaction, involving properties in fourteen states, has been under way for several months. When all the details of financing are worked out the stockholders and customers of the various Day & Zimmermann properties will find that their business will continue to be operated on the same high standard under the leadership of Charles Day and John E. Zimmermann, aided by the same men whose skill and vision have placed the management in the forefront of the public utility industry.

Bonds of Omaha Company to Be Extended

Plans are being advanced for the extension of the $9,155,000 of first consolidated mortgage 5 per cent bonds of the Omaha & Council Bluffs Street Railway, Omaha, Neb., from Jan. 1, 1928, then maturity date, to Jan. 1, 1931, at an advance in interest to 6 per cent. The trustee of the issue is the Guaranty Trust Company, New York. The bonds are secured by an absolute first mortgage on the 130.5 miles of track in Omaha. It is expected that in the interval between July 1, 1927, and Jan. 1, 1931, the question of the relations between the company and the city with respect to its franchise rights will have been satisfactorily adjusted.

Traffic and Revenue Results in Akron

Gross earnings of the transportation department of the Northern Ohio Power & Light Company, Akron, Ohio, for the year ended Dec. 31, 1926, were $454,255 less than in 1925. This loss of revenue is accounted for by further increases in the number of privately owned automobiles and because of partial suspension of railway service in Akron and on the interurban railway divisions in May last year. This suspension of service was caused by a strike or "walkout" on the part of some of the employees in the transportation department. The strike lasted from May 1 to May 22, when most of the men returned to work. This explanation was included in the annual report of the company to the stockholders.

The total number of revenue passengers carried was 63,372,334, compared with 65,619,603 in 1925. Of the total number of revenue passengers during the year 48,973,671, or 77 per cent, were carried on the city railway and bus lines and 14,398,663, or 23 per cent, were carried on the interurban and bus lines. Segregated figures show that the city divisions carried 2,379,178 fewer passengers in 1926 than in 1925 and that the interurban divisions carried 131,909 more passengers than in the preceding year.

Comparative figures of revenue passengers carried on rail and bus lines follow:

	City Systems	Interurban Systems
1922	50,632,248	17,117,064
1923	54,112,423	16,784,535
1924	48,563,053	14,478,984
1925	51,352,849	14,266,754
1926	48,973,671	14,398,663

A total of 140,696 tons of freight was handled during 1926 and the gross revenue therefrom was $614,762, compared with 160,823 tons handled in 1925 and gross revenue of $647,711.

In the transportation department the company continued its efforts in improving its service to meet the demands of the public. During the year it added quite largely to its motor bus equipment, and for the purpose of improving the special express bus service operating in Akron at a 10-cent fare it purchased two double-deck buses specially designed for one-man operation. To facilitate operation both of these buses are provided with front entrance, and one of them has the stairway from main to upper deck in the front part of the bus instead of the rear.

Among additions and improvements are included the following:

Purchase of 35 single-deck and two double-deck buses for operation in city and interurban service.

INCOME ACCOUNT OF THE NORTHERN OHIO POWER & LIGHT COMPANY FOR THE YEAR ENDED DEC. 31

	1926	1925
Gross Earnings:		
Electric	$6,317,554	$5,322,156
Transportation	5,723,286	6,177,541
Total	$12,040,840	$11,499,698
Operating expenses and taxes:		
Operating expenses	8,181,133	7,618,402
Taxes	802,200	822,000
Total	$8,983,333	$8,440,402
Gross income	3,057,507	3,059,296
Interest—net	1,527,628	1,428,680
Amortization of debt discount and expense	132,670	129,161
Total	$1,660,299	$1,557,841
Net income available for dividends and retirement reserve	$1,397,208	$1,501,454
Dividends on preferred stock	473,824	437,334
Balance	$923,383	$1,064,119
Ratio of operating expenses to gross earnings, per cent	67.94	66.25
Ratio of operating expenses and taxes to gross earnings, per cent	74.61	73.40

Rebuilding and equipping 46 city-type electric cars for one-man operation.

Purchase of 25 new freight trail cars and the reconstruction work necessary to convert two interurban passenger cars into freight motor cars.

Completion of modern freight houses in Akron and Bedford.

Renewal and reconstruction of track, both interurban and city, at various places on the system.

On the question of safety and accident prevention the report states that the situation is gratifying because of the good results obtained in the face of increases over 1925 in the number of car and bus miles operated and in the registration of private automobiles. Despite the great increase in automobile registrations from year to year and the resultant congestion of traffic, there were fewer accidents on the property in 1926 than in 1920.

B. C. Cobb, president, refers to the expiration of franchises for electric railway operation in the city of Canton on Feb. 23, 1928, and in the city of Akron on Nov. 12, 1928. In negotiating with the city authorities with respect to renewal rights, the management, he says, will make every effort to conclude fair and reasonable arrangements from the standpoint not only of return on the value of property used in rendering transportation service to the public but also from the standpoint of the people served.

Easement Case Closed in Baltimore

A valuation for easements of the United Railways & Electric Company, Baltimore, Md., probably will be fixed by the Public Service Commission within a month. Harold E. West, chairman, so announced on June 13 at the conclusion of hearings in the matter before the commission. A valuation of $7,000,000 was set originally by the commission, but a court order, following an appeal, required a rehearing of the case.

Edwin G. Baetjer, associate counsel for the United, at the hearing on June 13 charged that the valuation figure of $2,773,000 submitted by Thomas J. Tingley, people's counsel, was full of errors. Mr. Tingley in his final argument cited the opinion of the Court of Appeals in ordering the case to be reheard before the commission and interpreted it to mean that the court expected a lower valuation than $7,000,000 for the easements. Mr. Tingley said that the Court of Appeals recognized the fact that the value ascertained for rate purposes should be a relatively small one.

Counsel for the United contend that approximately $11,000,000 is the proper valuation for the easements.

Bus Lines in Washington Sold

The Washington Rapid Transit Company, owning bus lines in Washington, D. C., has been sold by the North American Company to Harley P. Wilson, who recently became a director in the latter company. The line is pressing an application before the Public Utilities Commission for a 10-cent fare. The North American Company is interested financially in the Washington Railway & Electric Company.

Revenue in Fort Wayne Higher

Operating revenue of the Indiana Service Corporation, Fort Wayne, Ind., in 1926 was $4,345,946, according to the annual report of the company made public on March 2. The figure shows a gain of $490,057, or approximately 13 per cent over operating revenue for the preceding year. Net income of the company in 1926, after payment of all charges, including interest on funded debt, totaled $420,963, as against $348,383 in 1925. Local and interurban transportation service was furnished to 25,667,845 passengers in 1926, compared with 25,648,155 in 1925.

Expenditures aggregating $2,012,000 were made during 1926 for various improvements and additions to the electric utility and railway systems, including the purchase of new equipment, construction of a new freight terminal, car shops and stores building at Fort Wayne.

The company acquired during the year the electric light and power and electric railway properties of four interconnected utility companies in the vicinity of Fort Wayne.

Robert M. Feustel, president, told the stockholders that a new issue of $890,000 par value 6 per cent preferred stock was offered to investors during the year. This issue is on a parity in every respect with the 7 per cent preferred stock issued in 1925, except as to annual dividend rate and callable price. The proceeds of the sale of this stock are being used to finance current corporate requirements.

Equipment trust certificates of series E in the principal amount of $160,000 and bearing interest at the rate of 6 per cent per annum were issued in 1926 to finance the acquisition of the five new passenger coaches and two parlor-buffet cars mentioned above.

As a result of the offering for sale of the new 6 per cent preferred stock, increasing numbers of customers, employees and other residents of the territory served became part owners of the company during 1926. A total of 4,238 stockholders was recorded on the company's books on Dec. 31, 1926. This represents a gain of approximately 256 per cent over the number recorded at the close of 1925.

Revenues in Albany Show Decrease

In the 97th annual report of the Delaware & Hudson Company for the year ended Dec. 31, 1926, statistics and operating results of the United Traction Company, Albany, N. Y., are included.

Operating revenues of the United Traction Company from all sources during 1926 amounted to $2,933,522, a decrease of $157,097; operating expenses were $2,370,907, a decrease of $58,768, and taxes were $213,100, an increase of $9,550. Operating income was $349,515, compared with $457,394 in 1925. Among the items of decreased operating expenses were: Injuries and damages, $12,828; paving, $2,947; transportation expenses, $59,800; power purchased, $2,205; maintenance of equipment, $20,215, and general and miscellaneous expenses, $2,639. These decreases were partly offset by increases in maintenance of structures, $129; maintenance of power and line, $8,747; track and roadway labor, $2,217; track and roadway material, $1,728; cost of removing snow and ice, $20,539, and equipment retirements, $8,579.

The company's proportion of the cost of new pavement laid in 1926 was $82,148, of which $29,603 was chargeable to operating expenses and the balance to cost of property used in public service. Reconstruction of tracks, made necessary by the continuation of street paving programs, cost the company $40,357, requiring charges to operating expenses of $37,507.

A petition for increased fare is now pending before the Public Service Commission and hearings have been concluded. The proceeding was delayed by an appeal to the courts, made necessary by the claim on behalf of certain municipalities that franchise restrictions deprived the Public Service Commission of authority to award reasonable rates. The Appellate Division, Third Department, denied these claims.

Operating revenues of the Hudson Valley Railway during 1926 amounted to $773,399, operating expenses to $787,308 and taxes to $50,850. There was an operating deficit for the year of $64,759, comparable with a deficit of $40,240 in 1925. Operating revenues decreased $60,526, operating expenses decreased $31,157, and taxes decreased $4,850.

The abandonments authorized by the Public Service Commission during the year 1925 have been physically completed. Application has been made to the Public Service Commission for permission to abandon the branch line between Thomson, N. Y., and Greenwich, N. Y., and the branch extending from Lake George, N. Y., to Warrensburg, N. Y.

Operating revenues of the Capitol District Transportation Company, Inc., bus subsidiary of the United Traction Company, amounted to $303,651 during 1926; operating expenses to $353,350 and taxes to $2,592. There was an operating deficit for the year of $52,291. On Nov. 6, 1926, operation of buses was started over what was formerly the Albia Line of the United Traction Company. A franchise to operate buses on the Third Street, Rensselaer Line of the United Traction Company was obtained during the year, and it is proposed to start bus service on that line during the early part of 1927.

Bonds of Berkshire Company Extended

The Department of Public Utilities of Massachusetts has approved the purchase by the New York, New Haven & Hartford Railroad of first mortgage bonds of the Berkshire Street Railway, Pittsfield, Mass., to the extent of not to exceed 50 per cent of the outstanding $770,000 of bonds so as to protect the railroad's stock interest in the railway. The New Haven company owns all of the capital stock of the Berkshire company. The bonds were extended in maturity date from June 1, 1922, to June 1, 1927, and have been further extended to June 1, 1937, at 6 per cent interest. The rate at present is 7 per cent. The New Haven Railroad is to pay not more than par for any of the bonds that it takes.

C. Q. Richmond, vice-president of the Berkshire Street Railway, has explained to the bondholders that the situation which has confronted the company, in common with most other electric railways, resulting from the increase in the use of the private automobile, made it difficult, if not impossible, for the company to provide the funds to pay off the bonds on June 1, or to arrange at this time to refund them upon satisfactory terms. Consequently, it became necessary for the directors to ask the bondholders to co-operate in a further postponement of the maturity date for the payment of the principal of the bonds.

The extension agreement provides that holders of the bonds may become parties thereto by deposit of their bonds with Harris, Forbes & Company, Inc. Bonds so deposited will be stamped with a reference to the agreement and additional coupons will be annexed to the deposited bonds providing for the payment of interest at the rate of 6 per cent on such bonds to and including June 1, 1937.

Mr. Richmond expressed the hope that all bondholders would defer the demand for payment of the principal of their bonds, but he explained that the principal stockholder of the railway, the New York, New Haven & Hartford Railroad, had agreed to purchase the bonds at par from holders who felt under compulsion to sell.

Road in Homestead to Be Abandoned.—Officials of the Homestead & Mifflin Street Railway, Homestead, Pa., organized in 1902 and operating a 3.7-mile line from Homestead to Lincoln Place, say they will abandon the line on Aug. 1. Stockholders claim they lost $20,000 on the Homestead lines in the last 25 years. Contemplated street improvements over the company's route would entail a $300,000 expenditure, which the stockholders do not feel able to meet. A bus line will supplant the railway system.

Personal Items

Up From the Ranks

H. M. Littig Advanced from Conductor to General Manager of Utility at Davenport

"What chance has a street car conductor today? He can never become anything else. The minute he takes such a job he admits to the world his business ability is nix, that he could not hold down a bigger and better job."

This remark was made by a young conductor in a midwestern city to a passenger who had asked him in a friendly way how he was getting on.

That same day in the same city the newspapers carried the announcement of the appointment of Harry E. Littig to be general manager of the Peoples Light Company, a $6,000,000 corporation. It was a promotion, the newspaper stories stated, for the new general manager had long held a responsible position with his company. Comment was made on his prominence in civic affairs and his other business connections, but none of these facts comprised the feature of the story.

H. M. Littig

What seemed to stand out as significant was that the new general manager had risen from the ranks of labor to the chair of business administration. He had worked his way up from the bottom. Mr. Littig is only in his forties and his future in the field of business is still an open road.

Leaving an Iowa farm, Harry Littig, a lad of 20, worked his way through a six months course in a business college in which unusual ability for figures was indicated. This course finished he applied for a job as street car conductor. Although he was under the required age of 21 the railway manager hired him. He liked the boy's looks. For a year and a half the young man ran a street car. His reports were so neat and his cash balanced so well with his trip sheets that on heavy days and during rush hours the manager put him on congested lines to collect fares.

One Sunday morning his chance came, his first chance. The cashier was sick. He heard about it on his early morning run and applied to the general manager for the job.

"Do you think you can do it?" the manager asked doubtfully.

"I'd like to try," the young man answered.

Pointing to the safe where the receipts of the runs during the last twelve hours were deposited, the manager handed the applicant the combination of the safe and said: "Go to it." A half hour later Mr. Littig said: "I have finished this. What shall I do next?"

Much in doubt as to its accuracy, owing to the record time in which the cash balance had been arrived at, the general manager checked the work done.

"It's the first time we've had an exact balance in six months," he commented. "We'll try you out."

Becoming cashier, Mr. Littig soon fell under the bookkeeper's eye. "Ever do any bookkeeping?" that worthy asked.

"A little," was the reply.

"Then you might as well help me out," the bookkeeper replied. And soon the cashier was doing most of the bookkeeping as well. Several months later the management made the young cashier the bookkeeper. Always knowing how to work and always willing to work, Mr. Littig became, as the years went along, chief clerk, then assistant treasurer, then assistant secretary and then secretary. While he was growing his company was also growing. From a railway undertaking it had grown to a railway and light enterprise. Today it is a subsidiary of a $190,000,000 corporation, the United Light & Power Company.

In these years Mr. Littig's home town, Davenport, Iowa, has also been growing, and with it he has grown, serving in every public money raising campaign in recent years, as president of the local Kiwanis club, as director in a score of volunteer movements where the only recompense was a sense of satisfaction in fulfilling one's civic duty. He is to-day essentially the same Mr. Littig who 31 years ago worked twelve hours a day, wore a uniform, had a number, ate cold lunch out of a lunch box and swept out his car with a broom.

O. D. Young Honored

The degree of Doctor of Commercial Science was conferred on Owen D. Young, chairman of the board of the General Electric Company, at the 95th annual commencement program at New York University held on June 8. Chancellor Elmer Ellsworth Brown, in conferring this honor, said that in American experience the practicing lawyer has passed by a more direct route to a position of leadership in a capital industry. Happy was the man who, having acquired so varied an experience and influence, found occasion to use his ripened powers for the public good; twice happy when he found occasion to use them for the wider good of the family of nations.

New Superintendent at Porto Rico —S. Howard Reid

S. Howard Reid has accepted a position with the Porto Rico Railway, Light & Power Company, San Juan, P. R., as superintendent of its electric railway division. This assignment became effective on June 13. For a number of years Mr. Reid has been superintendent of construction of export cars at the Philadelphia plant of the J. G. Brill Company.

The new incumbent at Porto Rico has been identified with the car building industry for more than 24 years. After leaving school he started his career with the Harlan & Hollingsworth plant at Wilmington, Del., from which he went to the American Car & Foundry plant, located in the same city. In 1902 he joined the forces of the J. G. Brill Company. Back in 1907 and up to 1909 he constructed and placed in service some of the first American equipment sent to Porto Rico, and in later years supervised the construction of a number of cars for Honolulu and Finland, which he also placed in service. Later he served as superintendent of equipment of the Honolulu Rapid Transit Company, which post he held until 1926, when he resigned to return to the Brill company.

S. H. Reid

Messrs. Luellen and Wells Promoted in Anderson

Ross E. Luellen, division passenger and freight agent of the Union Traction Company of Indiana, Anderson, Ind., was appointed assistant general passenger and freight agent with headquarters in Anderson effective on June 10. Mr. Luellen has been with the company since June, 1903, when he entered the service as clerk. Later he was made assistant claim adjuster and then promoted to safety engineer. From that position he was advanced to division passenger and freight agent.

Effective the same day, Ray J. Wells has been appointed chief clerk in the traffic department and will have charge of the advertising department. Mr. Wells was formerly secretary to the general manager. For seven years he was secretary to the general storekeeper of the C. C. C. & St. L. Railroad (the Big Four). He saw service in France in the railway engineering corps during the World War.

Changes in Brooklyn Personnel Announced

Three new division superintendents in the surface transportation department of the Brooklyn-Manhattan Transit Corporation, Brooklyn, N. Y., were appointed recently to fill vacancies caused by recent transfers and deaths in the organization. The new appointees are John H. Dirlam, at Flatbush depot; Joseph E. McClenahan at Bergen Street depot, and William J. Roome, at 58th Street depot. Mr. Dirlam succeeds the late John Mooney and Mr. Roome takes the place of the late Morton S. Cornell. Mr. McClenahan succeeds Herman Bongard, who is now on the staff of the Accident Prevention Bureau.

In addition August J. Eck was appointed assistant division superintendent. He is assigned to the Ninth Avenue depot to assist Charles B. Attlesey, division superintendent in charge of that depot. All these positions were filled by men who have worked their way up from the ranks. Three of the men started their careers in Brooklyn as conductors and the fourth as a transfer agent.

Guy Eastman Tripp Dead

Chairman of Westinghouse Company Was an Officer of More than 25 Corporations—Man of Many Talents, Widely Known for His Managerial Skill and Financial Ability

GUY EASTMAN TRIPP, chairman of the board of directors of the Westinghouse Electric & Manufacturing Company, a director and officer in more than a score of other corporations and a prominent figure in the public utility field for many years, died on June 14 at the New York Hospital, at the age of 62 years. He had been ill since February. On several occasions Mr. Tripp had so far recovered that he had been able to leave the hospital for a drive, and his restoration to health was at one time anticipated. Last month, however, a new, though minor, operation became necessary, and although he rallied from this and had even reserved accommodations at Atlantic City for the convention of the National Electric Light Association last week, a relapse set in.

Mr. Tripp possessed the organizing and executive type of mind developed to the full with no handicap of timidity. He was a business leader, a financier and a harmonizer. In his earlier days he displayed the ability to master detail, but as he was called upon to command he quickly developed the capacity to delegate details to others. He could get at the heart of a problem, shape a policy and leave others to work it out. He was not an engineer, but he could point the way to engineers. He always kept at heart the interests of the people at large, and while an advocate of private ownership of utilities under state regulation, he was, whether right or wrong, broadminded enough to declare that there might be conditions under which public ownership would be effective. His was an enlightened sense of business responsibility.

The foundation was there upon which to build, but Mr. Tripp spent a long term of apprenticeship in which he was engrossed in mastering the essentials of financial and management problems. In consequence, the ability displayed by him in later life to follow the intricacies of financial, engineering and operating problems came as a source of wonderment to those who were unacquainted with the breadth of the man's experience and were not in a position to know the extent to which he had gone to ground himself with an intimate knowledge of the basic facts. Mr. Tripp knew. And others knew that he knew, although they did not always understand how it was that he knew. So he was called to one stupendous job after another.

© Underwood & Underwood.

Guy E. Tripp

In all the history of American business operations there were no reorganizations that called for the exercise of greater financial and management skill than the rehabilitation of the Westinghouse company and the Metropolitan Street Railway. His accomplishments in these two instances alone would inscribe the name of the man high on the roll of honor of the immortals of organized business, but outstanding as were the achievements of Mr. Tripp in both of these instances they represented only a small part of the man's vast work.

Quite naturally men in railway circles, acquainted with Mr. Tripp's record for efficiency and appreciative of his wide knowledge of railway matters, felt relieved at his choice in 1910 as chairman of the joint committee on reorganization of the Metropolitan Street Railway, New York City, which had just passed into the hands of a receiver. The Metropolitan had many subsidiaries; the receivership, had of course, caused much concern among stockholders; possessors respectively of senior and junior securities were engaged in internecine warfare, and disaster loomed. For two years Mr. Tripp worked at his new task, evolving by degrees a solution that proved acceptable to the conflicting interests.

Then in January, 1912, he was unanimously invited by the directors of the Westinghouse Electric & Manufacturing Company to become chairman of their board. He went to the company while it, too, was emerging from a receivership, forced on it during the troublous times of 1907. It had been piloted through the crisis by Robert Mather, whose death left the vacancy that Mr. Tripp was called to fill. His duties concerned in the main the financial and foreign interests of the company, and he carried out, with clear insight and a firm hand, the reorganization of its capital structure and did much to place the company on the sound basis it now occupies, with annual gross earnings of $185,543,000 as of March 31, 1927, and a net manufacturing profit of $15,779,000. On assuming the chairmanship of the Westinghouse board Mr. Tripp resigned from the Stone & Webster organization.

When the United States entered the war Mr. Tripp was appointed by the Department of War chief of the production division of the Ordnance Department, instrusted with the task of supervising and stimulating the production of all ordnance supplies. He was breveted an officer and soon rose to the rank of brigadier-general, the title of "General," by the tacit insistence of his friends and associates, sticking to him for the rest of his life. When the World War broke out the Westinghouse company obtained large contracts from the British and Russian governments for the manufacture of munitions, and Mr. Tripp was thus able to bring not only his great ability but the highest type of experience to his new duties. He cut through red tape and decentralized bureaus with a vigor of action and clearness of perception such, it was declared, as official Washington had seldom seen, dividing the country into districts, each in charge of a district chief, and supervising the expenditure of $16,000,000,000. For his patriotic services General Tripp received from Congress a distinguished service medal.

Leave of absence was granted the General by the Westinghouse board during his war-time service. When the conflict was over he resumed his duties with the company. In 1923 these took him to Japan in connection with reconstruction work after the disastrous earthquake. He completed arrangements in that country for the organization of a manufacturing company at Nogoya with $7,500,000 capital. The

Japanese government conferred upon him the highest decoration that it could award to a civilian foreigner.

Likewise in the radio industry, Mr. Tripp, following his pioneering instinct, devoted his energies to the new art, and to him was due in large measure the position of leadership in radio manufacture and broadcasting that Westinghouse assumed and maintained. Another favorite interest of Mr. Tripp's was "superpower." He was among the first to grasp the part that interconnection would come to play in the world of light and power, and he did much to bring its significance home to the public.

ENTERED BUSINESS IN 1883

Mr. Tripp's business career began in earnest in 1883, when the Eastern Railroad—now part of the Boston & Maine—employed him as a clerk at Salem, Mass. After seven years with the railroad he changed his post for one with the United Electric Securities Company. With this company, the Thomson-Houston Electric Company and the Industrial Improvement Company, a branch of the then newly organized General Electric Company, which had absorbed the Thomson-Houston firm, he spent another seven years, working as accountant and auditor. Then, in 1897, at the age of 32, he began a connection with Stone & Webster, already engaged in the development of public utilities, that opened before him the path of substantial success. He was soon appointed a traveling auditor for this company, then was made a manager of utility properties in the West and South, and finally a vice-president of the parent engineering and management organizations. In addition he came to fill high executive offices in subsidiary companies in the States of Texas, Washington, Kentucky, Minnesota and Massachusetts.

Mr. Tripp was born in the village of Wells, in the southeast corner of Maine, on April 22, 1865. His academic instruction was obtained in a two-year course at the South Berwick Academy, near his birthplace. He went into a country store at Wells, and this, he often said, was his training school for judging values quickly, which stood him in good stead later in his life. That later life was crowded with such interests as engineering, electrical development, railroads, economics, politics, learning, sports and social intercourse.

A SPEAKER OF NOTE

The wonder was that the man found the time and had the energy to carry on all the multifarious activities in which he indulged. Among his notable addresses was the one made to members and representatives of the American Electric Railway Association on Feb. 20, 1925, at the annual dinner in connection with the association's midwinter convention. He discussed the place of the bus in transportation, mass transportation versus de luxe service, and urged single control of transportation facilities.

As indicated previously, Mr. Tripp manifested an especially keen interest in the future of electrical development in America. His war-time experience convinced him that power was an essential factor in our prosperity and he made an exhaustive study of the American power situation in order to determine the best and most efficient methods of power generation, transmission and distribution. His articles and addresses on power development attracted wide attention, and a compilation of the more important of these, published under the title of "Superpower as an Aid to Progress," is regarded as an authoritative contribution to this subject.

Tributes and Appreciations

From General Tripp's large circle of friends and associates many expressions of sorrow, admiration and personal regard were elicited when news of his death became public. A few of these are printed below:

From LUCIUS S. STORRS, *managing director American Electric Railway Association:*

"An incalculable loss has been suffered by the electrical industry, and particularly by the transportation industry, through the death of General Guy E. Tripp. It is a loss which all of us feel most deeply: a great personal loss as well as the loss of a progressive and courageous leader and wise counsellor. The electric railway industry will be forever indebted to him for the great works he wrought for it. His genius for organization, his broad vision, his farsightedness, his high patriotism, his courage and his intensely earnest friendships empowered him to great achievements for the industry to which he devoted his life and for the nation that he loved and served. Those of us who knew him intimately will miss him grievously, but his good works are builded upon an enduring foundation."

From GERHARD M. DAHL, *chairman of the board Brooklyn-Manhattan Transit Corporation, New York City:*

"General Tripp was a man of great ability, great heart and great soul. He was successful not only in all that he undertook but he tied his friends to him with hoops of steel. His death means a loss not only to the community but also to a host of loyal and admiring friends."

From MATTHEW C. BRUSH, *president American International Corporation:*

"The electrical industry has lost one of its great pioneers, leaders and executives. I know of no other man who had more friends, and in my entire acquaintance with him over a period of twenty-five years I have never heard other than the most kindly commendatory expressions about him by every one who knew him. He was a man to whom all his friends could go for advice, counsel and guidance. His memory will live long in our hearts."

From PAUL D. CRAVATH, *general counsel Westinghouse Electric & Manufacturing Company:*

"General Tripp will be greatly missed in the wide field of business and public activities. He was much more than the chief executive of a great corporation—he was a real leader in the industrial world. Important as is his loss to the business community, his associates in the enterprises in which he was active, and more especially the Westinghouse Electric & Manufacturing Company, will miss him most keenly as a loyal friend and a considerate and inspiring associate. There are few men in the business world who will be so sincerely mourned by so wide a circle of friends."

From H. HOBART PORTER, *president American Water Works & Electric Company:*

"We have suffered a great loss in the death of General Tripp. His influence for good was very strong in all his activities, both in commercial business and in war work. Few came into contact with him without being benefited other than by the geniality and magnetism which he always radiated. These qualities, in addition to his unusual ability, breadth of view and rugged honesty of purpose, endeared him to all with whom he came in contact."

From JAMES H. MCGRAW, *president McGraw-Hill Publishing Company, Inc.:*

"Apart from the important office that he filled, General Tripp's versatility and personal force made him one of the dominant figures in the electrical industry. His influence reached beyond the manufacturing sphere and embraced all electrical enterprise. As chief executive of the great Westinghouse interests his work was of tremendous importance to electrical men everywhere. In the light and power field the steady growth of interconnection owed much to him, and so did the spread of interest in good public relations. He was a steadfast friend of the technical press, to which he contributed much encouraging retrospect and prophecy through interviews and original articles. But among those who had the privilege of calling General Tripp their friend all such considerations are swallowed up in sorrow for the loss of an associate with so many sterling qualities. There was a nobility about him that endeared him to all. His genuineness and his faith in the electrical industry, in his co-workers and in his own ideas were a great resource to many men. His splendid qualities of leadership will be long remembered."

From OWEN D. YOUNG, *chairman of the board General Electric Company (radio message from S.S. "George Washington"):*

"The death of General Tripp takes from the electrical manufacturing industry one of its ablest and most charming men. He had all the qualities of a great leader, the capacity to foresee, the courage to act and the ability to execute. I have known him intimately for more than ten years with constantly increasing admiration and affection."

Others who expressed briefly, by wire, their sense of what the electrical industry, the business world and they themselves personally had lost through the death of General Tripp were Samuel Insull, president Commonwealth Edison Company, Chicago; E. S. Webster, president Stone & Webster; Thomas N. McCarter, president Public Service Corporation of New Jersey, and E. H. Gary, chairman United States Steel Corporation.

Pools and Cartels Summarized at Geneva

By Edward J. Mehren
Vice-President McGraw-Hill Publishing Company, Inc.

This is a continuation of Mr. Mehren's article on the final session of the International Economic Conference which appeared in last week's Journal, page 1068. — Editor's Note.

Pools and cartels formed one of the dominant subjects of the conference and resulted in quite a divergence of views. The conclusion was that they must be considered as good or bad, according to the spirit of their constitution and operation and the attitude of their managers toward the general interest. The field for such agreements, both national and international, is usually limited, so the conference declared, to branches of production already centralized and to products supplied in bulk or recognized grades.

Where applicable they can secure a more methodical organization of production, a reduction in cost by better utilization of equipment, the development on more suitable lines of new plant, a more rational grouping of undertakings, can check economic competition and reduce the evils resulting from fluctuations in industrial activity. By this means they may assure to the workers greater stability of employment, and at the same time by the reduction of costs and selling prices bring advantages to the consumer.

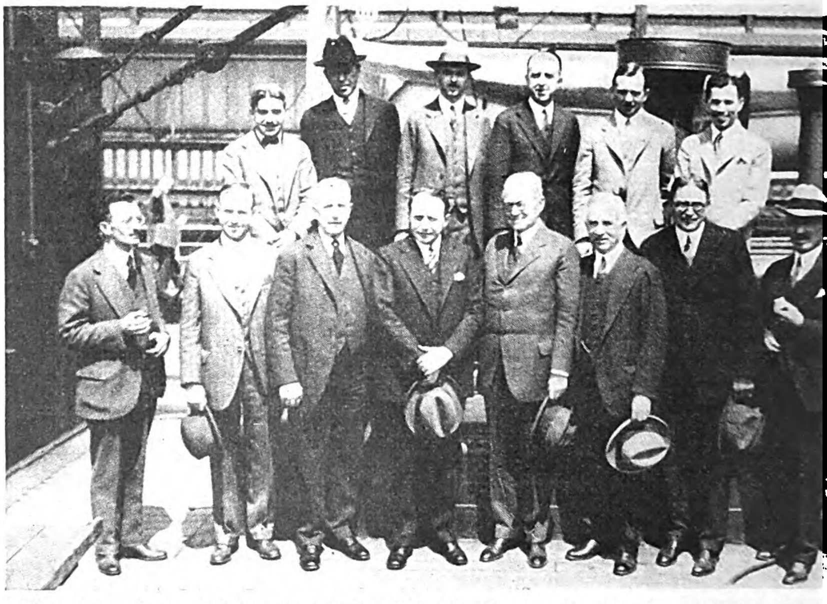
Nevertheless, the resolutions declared, if such agreements encourage monopoly and the use of unsound business methods, they may check technical progress and endanger the legitimate interests of sections of society and particular countries. Consequently such combinations should not lead to an artificial rise in prices, which would injure consumers, and should give due consideration to the interests of the workers. They should not restrict the supply of raw materials or basic products to any particular country nor create unequal conditions between the finishing industries of the consuming and producing countries. Nor must they prevent the development in any country of industries which that nation considers indispensable.

On the question of control of pools, the conference believed that international control of international pools cannot be set up. It recommends, however, that the League of Nations study these international pools, their effects on technical progress, on production, conditions of labor, supply and prices. This information, collected with the aid of the various governments, should be published. Such publicity is an effective means, on the one hand, of securing the support of public opinion for agreements which conduce to the general interest, and, on the other hand, of preventing the growth of abuses.

In this series of articles the term rationalization has been taken to mean all mechanisms for reducing cost of production and, therefore, the consolidation of industries has been included; this broad definition is in accordance with the German acceptance of the term. However, the conference limited it to scientific organization of labor, standardization both of material and of products, simplification of processes and improvements in the system of transport and marketing.

While obvious to us in America, the conclusions are so important for Europe that they are given here in full:

> The conference considers that one of the principal means of increasing output, improving conditions of labor and reducing costs of production is to be found in the rational organization of production and distribution.
>
> The conference considers that such rationalization aims simultaneously:
>
> 1. At securing the maximum efficiency of labor with the minimum of effort.
> 2. At facilitating, by a reduction in the variety of patterns (where such variety offers no obvious advantage), the design, manufacture, use and replacement of standardized parts.
> 3. At avoiding waste of raw materials and power.
> 4. At simplifying the distribution of goods.
> 5. At avoiding in distribution unnecessary transport, burdensome financial charges and the useless interposition of middlemen.
>
> Its judicious and constant application is calculated to secure:
>
> 1. To the community greater stability and a higher standard in the conditions of life.
> 2. To the consumer lower prices and goods more carefully adapted to general requirements.
> 3. To the various classes of producers higher and steadier remuneration equitably distributed among them.
>
> It must be applied with the care which is necessary in order, while at the same time continuing the process of rationalization, not to injure the legitimate interests of the workers, and suitable measures should be provided for cases where during the first stage of its realization it may result in loss of employment or more arduous work. It requires, further, so far as regards the organization of labor in the strict sense of the term, the co-operation of employees and the assistance of trade and industrial organizations and of scientific and technical experts.
>
> The conference accordingly recommends that governments, public institutions, trade and industrial organizations or public opinion, as the case may be,
>
> 1. Should lead producers to direct their endeavors along the lines indicated above, and, in particular
>
> (a) To encourage and promote in every way the investigation and comparison of the most adequate method and most practical processes of rationalization and of scientific management, and of the economic and social results obtained thereby.
>
> (b) To apply these endeavors in industry, agriculture, trade and finance, not merely to large but also to medium and small undertakings, and even to individual workers and handicraftsmen, bearing in mind the favorable effects which they may have in household organization and amenities.
>
> (c) To give special attention to measures of a kind calculated to insure to the individual the best, the healthiest and the most worthy employment, such as vocational selection, guidance and training, the due allotment of time between work and leisure, methods of remuneration, giving the worker a fair share in the increase of output, and generally conditions of work and



The American delegates of the World Economic Conference at Geneva and the expert advisers who accompanied them

Bottom row, reading from left to right: Henry Chalmers, chief of the foreign tariffs division of the Bureau of Foreign and Domestic Commerce; Dr. Arthur N. Young, economic adviser, Department of State; Roland W. Boyden of Boston, representing the International Chamber of Commerce; Dr. Julius Klein (delegate), director Bureau of Foreign and Domestic Commerce, Department of Commerce; Henry M. Robinson (chairman of the delegation), president First National Bank, Los Angeles; Norman H. Davis (delegate) formerly Assistant Secretary of the Treasury and Assistant Secretary of State; Alonzo E. Taylor (delegate), director, food research, Stanford University; Dana Durand, chief of the research division, Bureau of Foreign and Domestic Commerce.

Top row, reading from left to right: Dr. Louis Domeratzky, chief of the regional division of the Bureau of Foreign and Domestic Commerce; John P. Frey, editor *Molders' Journal*, adviser on labor questions; Edward Eyre Hunt of Washington. D. C., Department of Commerce; Grosvenor Jones, chief of the finance division, Bureau of Foreign and Domestic Commerce; E. W. Camp, commissioner of customs, Treasury Department, and W. L. Finger, secretary to Dr. Julius Klein, serving as administrative aid. John W. O'Leary, the fifth American delegate to the conference, is not in the picture.

life favorable to the development and preservation of his personality.

2. Should carry on systematically on an international as well as a national basis the standardization of materials, parts and products of all types which are of international importance, in order to remove the obstacles to production and trade which might arise from a purely national policy of standardization;

3. Should undertake on an international basis investigations for ascertaining the best methods employed and the most conclusive results obtained in every country in the application of the principles set out above, utilizing the investigations already made in certain countries and encouraging the exchange of information among those concerned.

4. Should spread in all quarters a clear realization of the advantages and the obligations involved in rationalization and scientific management as well as of the possibility of their gradual achievement.

OTHER RESOLUTIONS

With reference to the remaining resolutions, sufficient information has been given in articles already published in this paper to make repetition unnecessary here. The recommendations on commerce were lengthy, occupying, with explanations, thirteen printed pages of legal-cap size. They warrant the careful study of every American interested in foreign trade.

Two days before the closing of the conference the delegation from Russia, or from the Union of Socialist Soviet Republics, as they call it, demanded that there be a resolution recognizing the coexistence of the two economic systems, their own and that of the rest of the world, threatening otherwise to withdraw from the conference. A compromise was reached through the efforts of Roland W. Boyden of Boston, representing the International Chamber of Commerce. He introduced a resolution which declared that the conference recognized the importance of the renewal of world trade and that while refusing to infringe upon political questions regarded the participation of delegates from all the countries present, irrespective of differences in their economic systems, as a happy augury for a pacific commercial co-operation of all nations. This resolution adopted, the Soviet delegates were satisfied and they remained in the conference to the end, though they voted against all resolutions that ran counter to their economic system or practice.

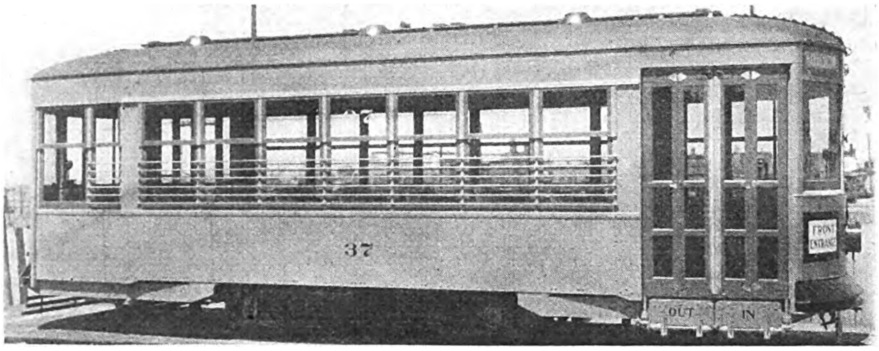
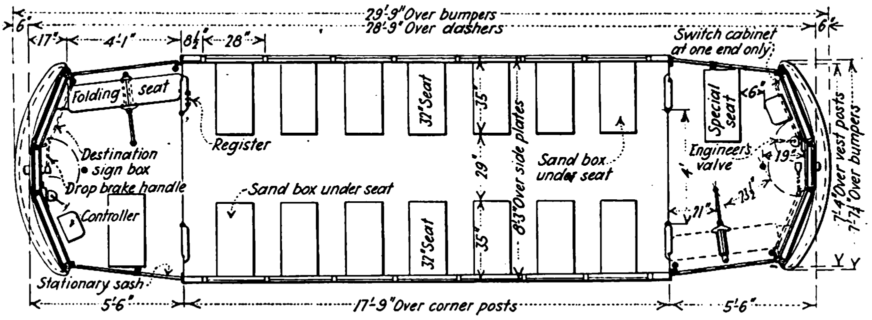
New One-Man Cars Operating in Mobile, Ala.



Two of these 32-passenger one-man, double-end units are now serving the riding public at Mobile



Seating arrangement and general plan of new Mobile cars

Two one-man, city type, double-end cars were delivered to the Mobile Light & Railroad Company, Mobile, Ala., on May 2 by the American Car Company, St. Louis. Subjoined are specifications covering this equipment:

Number of units	Two
Type of unit	One-man, motor, passenger, city, double-end, single-truck
Number of seats	32
Weight, total	20,000 lb.
Length over all	29 ft. 9 in.
Length over body posts	17 ft. 9 in.
Truck wheelbase	8 ft. 6 in.
Width over all	8 ft. 3 in.
Height, rail to trolley base	10 ft. 4 in.
Window post spacing	2 ft. 4 in
Body	All steel
Roof	Arch
Doors	End
Air brakes	General Electric CP-27
Armature bearings	Plain
Axles	A.E.R.A. standard
Car signal system	Faraday
Compressors	General Electric
Control	K-63 BR
Couplers	Detached link and pin
Curtain fixtures	Curtain Supply Co.
Curtain material	Pantasote
Destination signs	Hunter
Door mechanism	National Pneumatic Co.
Doors	Folding
Fare boxes	Johnson
Finish	Enamel
Gears and pinions	General Electric
Glass	Plate D. S. A.
Hand brakes	Brill drop handle
Headlights	Ohio Brass
Interior trim	Plain mahogany
Journal bearings	Plain MCB-Brill
Journal boxes	Brill
Lamp fixtures	General Electric
Motors	General Electric, No. 265, inside hung
Painting scheme	Yellow
Registers	International R5
Roof type	Arch
Roof material	Poplar tongue and groove
Safety car devices	Safety Car Devices Co.
Sash fixtures	O. M. Edwards
Seats	Brill
Seat spacing	29 in.
Seating material	Wood
Slack adjusters	Brill
Steps	Folding
Step treads	Feralun safety
Trolley catchers	Earll
Trolley base	U. S. No. 20-A
Trolley wheels	4 in. brass
Trucks	Brill 79-E-2
Ventilators	Brill
Wheels, type	Steel, diameter 26 in.
Special devices	H. B. life guards

Philadelphia Subway Signal Contract Awarded

Through its Department of City Transit Philadelphia has awarded a contract to the Union Switch & Signal Company, Swissvale, Pa., covering the complete installation of automatic block signaling, electro-pneumatic interlockings and automatic train stop equipment in the new Broad Street subway. This subway begins at the City Hall and extends northward 6 miles to Olney Avenue and Fern Rock yard, with the present layout embracing two tracks through this territory. The ultimate future arrangement will provide for four tracks throughout. Included under this contract are 264 color light signals, 93 interlocked switches, 117 electro-pneumatic automatic train stops, etc. Direct current at 630 volts will be used for propulsion purposes of the rolling equipment, with double rail return alternating-current track circuits through the entire block signaling territory. Six electro-pneumatic interlocking plants at City Hall station, Spring Garden Street, Girard Avenue, Erie Avenue, Olney Avenue and the yard portal will be installed, with two storage yard interlockings at Fern Rock, the northern terminus of the subway.

Contention of Toledo Torch Upheld

The United States District Court of the Northern District of Ohio, Western Division, in the case of Wilbert J. McCloskey, trading as McCloskey Torch Company, plaintiff, vs. the Toledo Pressed Steel Company, Toledo, Ohio, defendant, holds that U. S. Letters Patent No. 1,610,301, issued to Wilbert J. McCloskey on Dec. 14, 1926, is invalid as to all of the claims thereto and bill of complaint is dismissed in favor of defendant. This does not affect U. S. Letters Patent issued to the Toledo Pressed Steel Company covering its product the Toledo torch.

Lower Prices for All Metals

Lower prices characterize the domestic markets for all of the non-ferrous metals. Activity in lead has been well up to the average at prices only fractionally lower than a week ago. Zinc has been comparatively quiet, closing the week at 6.25 cents St. Louis. Tin has been moderately active, with prices off about ½ cent, and the copper market has been virtually dead, such sales as have been made in the last two days being at 12.50 cents delivered in the East. Quicksilver and antimony prices are lower, whereas platinum is practically unchanged. Silver has fluctuated within narrow limits, being quoted at 57 cents today. Buying of copper has been practically non-existent, aggregate sales being lower than for any week in the last two years at least. On June 9 two sales were made at 12.725 cents in Connecticut and subsequently several small orders were placed at as high as 13 cents delivered in the Middle West. However, the only sales of consequence since Saturday have brought only 12.50 cents for Connecticut delivery. Buyers, presumably, have been awaiting the appearance of the May statistics, which have just been issued.

With the volume of buying somewhat less than the average, zinc prices have ranged between 6.20 cents and 6.30 cents during the week, the closing price, 6.25 cents, being slightly lower than a week ago. Statistics issued by the American Zinc Institute in tons of 2,000 lb. show the following:

Stock, May 1	41,208
Produced	51,296
	92,594
Shipped	50,458
Stock, May 31	42,046
Shipped from plant for export	4,898
Total retort capacity at end of period	136,844
Number of idle retorts available within sixty days	53,749
Average number of retorts operating during period	79,846
Number of retorts operating at end of period	79,057

The American Smelting & Refining Company has all along maintained its contract price at 6.40 cents, New York, since May 26. On Thursday and Friday some business was done at five or ten points premium over this level, but in the last few days sellers have been unable to get any more than the Smelting company's price except for special lots. Forward lead sold as high as 6¼ cents, St. Louis, on June 9, and a good tonnage was also booked at 6.225 cents. Some sellers, however, were willing to book lead for delivery up to the end of July at no more than 6.175 cents on that day.

Rolling Stock

Houston Electric Company, Houston, Tex., has ordered twenty new street cars powered with four 35-hp. motors from the St. Louis Car Company. The new cars, one of which will be exhibited at the annual convention of the A.E.R.A., at Cleveland in the fall, seating more than 50 passengers, will be larger than any now in use in Houston, and will be of the most modern design, with clear-vision windshield and electric windshield wipers, many safety devices and fully upholstered. They will cost $17,000 each. It is reported that ten new buses have been ordered at a cost of $10,500 each.

Connecticut Company, New Haven, Conn., has ordered from Mack Trucks, Inc., three 29-passenger city type buses, 225-in. wheelbase, four-cylinder motors.

United Electric Railways, Providence, R. I., has ordered four 29-passenger, 233-in. wheelbase, six-cylinder city type Mack buses.

County Transportation Company, New York, bus operating subsidiary of the New York, Westchester & Boston Railway, has accepted delivery of two 29-passenger Mack city type buses, 225-in. wheelbase, four-cylinder motors. Operation in Westchester County will start with twelve buses of this type.

Washington Railway & Electric Company, Washington, D. C., recently purchased three street car type 21-passenger Yellow buses.

Illinois Power & Light Corporation, Peoria, Ill., recently bought seven street car type Yellow buses with a capacity for 21 passengers.

City Railway, Los Angeles, Cal., recently purchased six Yellow buses divided as follows: Four 29-passenger street car type buses on 230-in. wheelbase chassis and two 21-passenger street car type buses, all of Yellow base.

Pacific Northwest Traction Company, Seattle, Wash., has accepted delivery of three Fageol (Cal.) buses. Two of these are of the cupola observation type and the other is a regular observation type parlor car.

Los Angeles Railway, Los Angeles, Cal., has accepted delivery on four street car type buses manufactured by Fageol (Cal.)

Market Street Railway, San Francisco, Cal., recently bought a Fageol (Cal.) street car type bus.

Track and Line

Portland Electric Power Company, Portland, Ore., has received permission to replace the car tracks in Oregon City with the latest type of heavy rails, including the placing of a new concrete track base with cement instead of brick between the rails. Work is to go forward as soon as the new rails arrive. The cost is estimated at $50,000.

The Cincinnati Street Railway, Cincinnati, Ohio, started work June 1 on two additional major track reconstruction projects. One is on Anthony Wayne Avenue, from Lockland Avenue to Mills Avenue, and the other on Montgomery Road, from Blair Avenue to the Norfolk & Western Railroad. The work on Anthony Wayne Avenue involves 12,675 ft. of single track, at an estimated cost of $117,230, and the work on Montgomery Road, 6,253 ft. of single track, involving an expenditure of $66,467. The type of construction specified is 93-lb. T-rail, 7 in. high, on steel ties imbedded in concrete, and welded joints.

ELECTRIC RAILWAY MATERIAL PRICES—JUNE 14, 1927

Metals—New York

Copper, electrolytic, cents per lb.	12.50
Lead, cents per lb.	6.40
Nickel, cents per lb.	35.00
Zinc, cents per lb.	6.63
Tin, Straits, cents per lb.	67.75
Aluminum, 98 or 99 per cent, cents per lb.	26.00
Babbitt metal, warehouse, cents per lb.:	
Commercial grade	61.00
General service	31.50

Bituminous Coal

Smokeless mine run, f.o.b. vessel, Hampton Roads	$4.475
Somerset mine run, Boston	1.875
Pittsburgh mine run, Pittsburgh	2.05
Franklin, Ill., screenings, Chicago	‡
Central, Ill., screenings, Chicago	‡
Kansas screenings, Kansas City	2.675

Track Materials—Pittsburgh

Standard steel rails, gross ton	$43.00
Railroad spikes, drive, 9/16 in. and larger, cents per lb.	2.90
Tie plates (flat type), cents per lb.	2.35
Angle bars, cents per lb	2.75
Rail bolts and nuts, cents per lb.	3.95
Steel bars, cents per lb.	1.80
Ties, white oak, Chicago, 6 in.x8 in.x8 ft.	$1.45

Hardware—Pittsburgh

Wire nails, base per keg	2.50
Sheet iron (24 gage), cents per lb.	3.00
Sheet iron, galvanized (24 gage), cents per lb.	3.85
Galvanized barbed wire, cents per lb.	3.20
Galvanized wire, ordinary, cents per lb.	2.40

Waste—New York

Waste, wool, cents per lb.	12–18
Waste, cotton (100 lb. bale), cents per lb.:	
White	12–17.50
Colored	7–14

‡ Quotations withdrawn because of strike.

Paints, Putty and Glass—New York

Linseed oil (5 bbl. lots), cents per lb.	11.6
White lead in oil (100 lb. keg), cents per lb.	13¾
Turpentine (bbl. lots), per gal.	$0.59
Putty, 100 lb. tins, cents per lb.	5.25–5.50

Wire—New York

Copper wire, cents per lb.	15.00
Rubber-covered wire, No. 14, per 1,000 ft.	$5.15-$5.20
Weatherproof wire base, cents per lb.	16.00

Paving Materials

Paving stone, granite, 5 in.	
New York—Grade 1, per thousand	$150
Wood block paving 3½, 16 lb. treatment, N. Y., per sq.yd.	$2.70
Paving brick 3½x8½x4, N. Y., per 1,000 in carload lots	51.00
Paving brick 3x8½x4 N.Y., per 1,000 in carload lots	45.00
Crushed stone, ¾-in., carload lots, N. Y., per cu.yd.	1.94
Cement, Chicago consumers' net prices, without bags	2.05
Gravel, ¾-in., cu.yd., f.o.b. N. Y.	1.75
Sand, cu.yd., f.o.b. N. Y.	1.00

Old Metals—New York and Chicago

Heavy copper, cents per lb.	10.625
Light copper, cents per lb.	9.25
Heavy yellow brass, cents per lb	6.875
Zinc, old scrap, cents per lb.	3.875
Lead, cents per lb. (heavy)	5.375
Steel car axles, Chicago, net ton	$17.25
Cast iron car wheels, Chicago, gross ton	13.75
Rails (short), Chicago, gross ton	15.25
Rails, (relaying), Chicago, gross ton (65 lb. and heavier)	28.50
Machine turnings, Chicago, gross ton	7.00

San Francisco's Municipal Railway Bond Proposals to Be Resubmitted

RESULTS of the bond election on June 14 leave San Francisco in a peculiar position. As things stand the city is faced with the problem of a municipal railway tunnel and no money to run the railway through it, the same situation with respect to the Bernal cut, and no place to put Hetch Hetchy water when it arrives. The proposal for municipal railway extensions and additions involved the sum of $4,700,000. So far as the extensions are concerned, a part of them, particularly the Sunset-Judah line, are in the nature of a moral obligation. They were pledged at a time property was assessed for other improvements. The Sunset District paid $1,700,000 for the tunnel and felt that it was entitled to a promised rail extension.

Proponents of the measures defeated at the election say the defeat was due to the small vote. Their idea is to realign their forces so that the matters can be resubmitted at the regular municipal election in the fall. The reasons advanced for the defeat of the measures may or may not be correct, but it is in the record that they were defeated and that the city officials are confronted with the serious situation to which reference has been made. It does seem, however, that the citizens of San Francisco were particularly apathetic about a matter so important to some of them. Certainly the proposals were not without their vociferous adherents. The leader of these quite naturally was the *Examiner*. One of its flights of editorial fancy was headed "Muni Cars Have Created Miracles in New Wealth." That paper said that while the city of San Francisco had grown 57 per cent in assessed value since 1912, five residential districts opened and served by the municipal street cars had grown 267 per cent, or five times as fast as the average. There is no reason to quarrel with this as a statement of fact, but even allowing full credit to the railway for its part in the increase, the statement is over-sanguine in its implications. The burden of the paper's song was that the bonds for extending the municipal cars into Sunset Parkside, Excelsior and other "new" districts deserved to pass by an overwhelming majority. With this the people of San Francisco, or at least the voters who went to the polls, did not agree.

All through the agitation over the submission of the issue to the voters, the Market Street Railway, privately owned, appears to have devoted itself entirely to minding its own business. Its activities took no cognizance of playing politics. Bereft of anything else to say following the election, the *Examiner*, realizing its position to be extreme, warned its readers to watch for corporation moves, saying that the Market Street Railway may confidently be relied upon to open up some sort of a drive to get the use of the people's Duboce tunnel and Bernal cut as its private right-of-way. Moreover, that paper renewed its prophecy to the effect that the "Market Street Railway will try to lengthen and strengthen its tentacles upon San Francisco." All of which goes to show the extent to which the propagandist will go in trying to bedevil a situation in which the only desire of the one who stood by was to remain a silent spectator. It will be interesting to see what the people of San Francisco do when the matter is resubmitted to them in the fall.

Things that Are Too Cheap Are Costly

BEING a large consumer of oil and its by-products, the electric railway industry necessarily is vitally interested in the chaotic condition now existing in the oil industry, which has taken the form of a hysteria of over-production and an uneconomic variation of price. In common with other consumers, the electric railways are concerned with the question, where will this lead? In such a frame of mind, therefore, it would be well for the industry to study the analysis of the situation as recently made by E. W. Clark of Los Angeles, president of the American Petroleum Institute.

While claiming to possess no panacea, Mr. Clark in addressing 600 oil engineers and technologists at Colorado Springs has unearthed some salient facts that should clear the air considerably.

In pointing out the possible causes for the present situation, this authority stated that the system of oil production was not designed deliberately by any one. It is not some prearranged co-operative thing. In times past the industry was in much the same position as a man who stokes his furnace in hot weather, thereby violating both an economic and a physical law. Production has run around the industrial cycle because this lesson has not stuck and the industry has failed to check or limit its individual activities until so late that none of the operators seems at this time wise enough or powerful enough to stem the flood. Continuing further, we read that the more wells the industry drills at the same time, the greater the per barrel increase in the cost of the total oil recovered from the pool; second, that the more wells drilled at the same time, the more gas pressure is immediately released, thereby diminishing the total ultimate oil recovery because maintenance of gas pressure increases the rate of yield and the total amount obtainable, and, third, that the more wells that are drilled at the same time, the greater the likelihood of bringing to the surface a quantity of oil which will be forced on an over-supplied market at a price so low as to lead to wastefulness and disregard of essential values.

Overshadowing these elements of inefficiency and waste, it is learned that the present critical situation must not be considered merely in the terms of the Seminole, Earlsboro, Spindletop and Panhandle strikes, but from the greater perspective of the world's ultimate production. Russia, Venezuela, Colombia must be considered; also the great Persian Mesopotamian area of the middle East, all of which dwarf the significance of a few local and temporary phenomena of oil production here in the United States.

From these very candid admissions, we may deduce much that is helpful. The oil industry, in other words, has no standardized program. Apparently it is every man for himself and the devil take the hindmost. There has been such a wealth of production in this country that it has neglected the future staggering competition that is breeding in other countries. Over-production has, as is always the case, opened the gates for mushroom operators who, when production decreases, are generally forced out of the game, thereby leaving the large producers to fight a competitive battle.

With this last deduction we come to the crux of the situation in so far as it affects the electric railway industry. As an industry we have stood for one management in one area. This stand does not necessarily mean that we approve of a combination in restraint of trade; rather is it a combination to give better service. But on the other hand, indorsing single management that furnishes adequate service creates a reserve for improvements and in general protects the public as opposed to fly-by-night operators, inadequately financed, who in the end work to the detriment of those who consume their products. This situation is analogous, in so far as the industry is concerned, with oil and oil production. As consumers the railway industry, therefore, must subordinate its desire to buy cheaply to the sounder economic consideration of helping a big industry to stabilize prices and production that will result in uniformity and in the long run greater economy. It must stop looking through the wrong end of the telescope and remember that the things that are too cheap are costly.

Public Transportation Operators Must Lead in Solving Traffic Problem

WITH each sale of an automobile the traffic problem increases. While a few years ago it was only in the largest cities that traffic congestion was serious, today even modest hamlets have their crowded intersections, with officers directing the movement of vehicles. So serious has the problem become that public transportation, whether by street car or by bus, is seriously hampered. The organizations giving this service cannot sit quietly by and allow the civic authorities to handle the situation unaided. All too often city officials do not sense the real difficulty, and even when they do they are prone to heed the owner of the automobile in his claim for preferment as against the street car or bus.

A situation such as this demands that the street railway man, instead of drifting along with the current, become the leader in devising plans to ameliorate conditions. It is true that the transportation company will be the chief beneficiary. It is equally true that every resident of the community and every visitor to it will be the gainer if a solution is worked out that brings real relief. Petty jealousies and claims for preferment must be cast aside, and every proposal must be judged on its merits.

That much can be done in improving traffic conditions is indicated by the analysis presented by L. M. Traiser in this week's issue. The importance of an adequate traffic survey cannot be over-estimated. Only with complete information can the true requirements be determined, and only with the facts before them can those in control deal justly with the various elements. Such things as the use of intersections, the waste of time due to wrongly placed and wrongly operated signals and the evils of street parking can be taken from the realm of conjecture into the field of cold statistics.

As to the answer, it may differ in each community. There is a certain similarity, however, which makes it possible to lay down rules that must be followed to obtain real relief. Some of the elements are mentioned by Mr. Traiser, and there are many others with which the experienced traffic man is conversant. As in so many other features of transportation service, only co-operation will bring about the best results.

Showmanship May Be a Necessary Element

ON ANOTHER page of this issue is an account of the celebration staged by the Cincinnati, Hamilton & Dayton Railway to mark the completion of its rehabilitation program. There is no need to repeat here the features of that event, the most spectacular one being a bonfire in which the old cars were destroyed, but it is fitting that its significance be considered for a moment.

First, there is the fact that the management of the C., H. & D. was quick to recognize a good idea developed on another property and to apply it as a means of winning public interest and attention to the completion of a laudable rehabilitation program. Grand Rapids had shown the way. The C., H. & D. took up the idea and used it with attention to arrangements and details that reflected a ready grasp of the mechanism of showmanship. In the past the tendency has been too pronounced to deprecate rather than to utilize new ideas developed on other properties.

That this public celebration to mark the passing of the old facilities and the coming of the new succeeded at least in arousing great public interest was indicated by the thousands of automobiles that jammed for hours every approach to the bonfire, and by the good-natured multitudes that cheered and applauded every event on the program. There was no question left in the minds of observers but that the effort and money expended by the railway were repaid many-fold in good will and community-wide publicity. It was evident also that the success achieved was attributable largely to the meticulous care with which even minor details of the event were planned and the accuracy with which public reactions were anticipated.

What, then, does this signify? Surely there is something more in the C., H. & D. celebration and the results accomplished than merely that another railway held a public bonfire of its old cars. That something seems to be that there is another component in the little understood term "Merchandising Transportation." The industry is just beginning to understand some of the rudiments of salesmanship and of advertising. It is beginning to understand that the first step in merchandising anything is to make the product fit the public demand. Now there seems to be reason for concluding that "showmanship" may also have an important place in attracting public interest as a step in a merchandising program.

Remember, There's Always a Private to Wield the Marshal's Baton!

JUST as though belated recognition were denied it, democracy occasionally does something sensational which focuses the attention of all upon its exploits, deals a blow to the persiflage of the superior ones and wins new sympathizers to the "up from the ranks" theory. Such a condition has arisen following the awarding of 1927 commissions at West Point to two honor men who were appointed from the regular army to the academy, entrance to which was barred to enlisted men until a few years ago. The accomplishments of these two cadets prove that they are at least not inferior to the West Pointers, and it may prove that their former training was instrumental in their success.

"Up from the ranks" is a drama with good material on any stage. On the railway stage there are many supers and extras who could well take the lead if they were given the opportunity to show their latent talents. The disposition has been growing to take into greater account the unheralded employee who is up for a position of responsibility and trust, but the road to success will be traversed by many more willing feet only as this inclination to consider the possibility of men who constitute the rank and file becomes more and more pronounced.

In the railway field the desideratum is the right man in the right job. Often it is realized. There will be occasional misfits, but there will be fewer maladjustments when the managements consider enthusiasm and capacity for hard work attributes of the prospective promotee, for frequently linked with them is a talent waiting only development.

Stories of men who came "up from the ranks" in the railway business may be lacking in the sensationalism attached to the success of the honor men at West Point, but nevertheless they are pleasing parallels. These recitals of "career" men should serve as an inspiration to the employee still groping his way out of the ranks and as a corrective to that fallacious note in "up from the ranks."

Progress that Is the Result of Intelligent Work

SOME one has said that progress is the result of intelligent work; that there is no goal previously attained but what can be passed. These maxims have been splendidly substantiated by the exhibit committee of the American Electric Railway Association, which after 29 working days reports the sale of 105,402 sq.ft. of exhibit space for the next annual convention. This figure represents both progress and the fact that a previously attained goal has been passed. It represents, however, more than this when we view the committee's endeavors in the light of the industry as a whole. The very fact that there were at the close of business June 18 22 more applications than for the same period last year reveals a fine effort on the part of the manufacturing interest allied to the industry to place before operators all that is best and latest in the way of improvements. The increase in applicants also gives the lie to those who assert that the street car is doomed.

So much then is the result of 29 days of consistent, intelligent work, into which has been infused the infectious enthusiasm of the man who is the director of exhibits for the association. But this is only a beginning. There are several months ahead in which opportunity will be given those who have not yet applied for space to build on the foundation which the committee has so thoroughly prepared. It is to their interest to follow the example of more than 200 co-manufacturers whose abiding faith in the industry points a moral and adorns a tale. Their faith has been expressed in deeds, and their leadership should beget many followers.

Keeping Abreast of Public Demands Is an Endless Process

MONEY in ever-increasing quantities must be poured by the railways into plant and equipment needed to meet increasing public demands. There is nothing new in this to railway men, but there is a great deal that is new about it to the general public. And the railway misses an opportunity when it does not enlighten the public on this matter.

No annual statement worthy of the name but contains some tangible reference to the sums so spent. One that comes forcefully to mind, however, is the record of the Boston Elevated Railway in this respect. The expenditures for plant and equipment do mean something, and in the case of this company they have meant the sum of $33,570,000 in the last 8½ years of the public trusteeship. This money has been divided as follows: Cars and buses, $15,463,000; carhouses, shops and garages, $6,171,000; power houses and transmission of electricity, $4,117,000; surface lines (track and line betterment), $4,906,000; elevated structure and appurtenances, $2,013,000; miscellaneous improvements, $900,000. In addition to these sums, $3,434,000 had been expended upon road and equipment in excess of any capital issues at the time the trustees took charge of the railway on July 1, 1918, making the grand total to be provided for during the 8½ years of public control about $37,000,000.

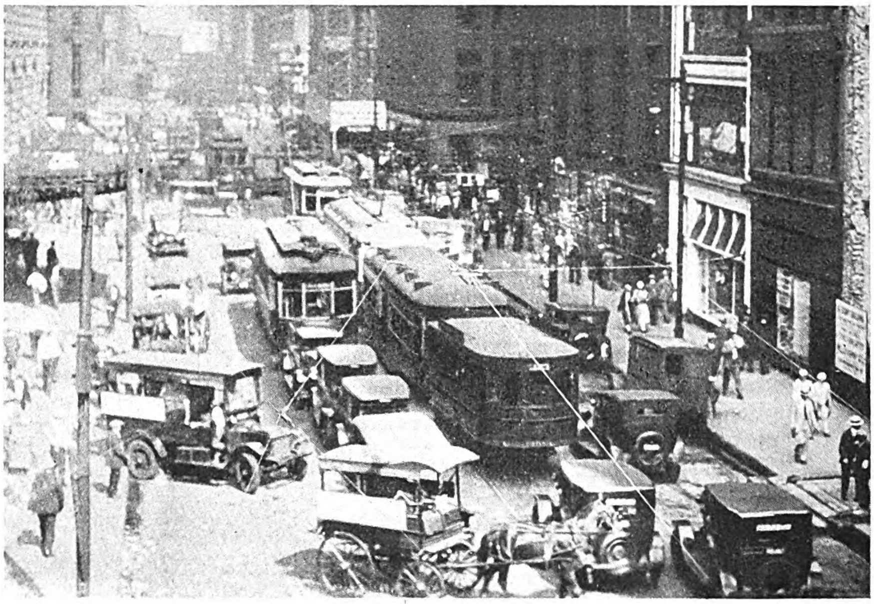
It is estimated that $18,856,000 of this was available from depreciation charges, but the rest had to be financed and it was no easy task. And the Boston Elevated hasn't overdone the thing by any means. Last year the system carried 6,000,000 more passengers than were carried in 1925. In all 2,385,255 more miles were run and 338,144 more round trips were operated. The number of bus-miles almost doubled. In its effort to keep abreast of its obligations replacement of the last wooden elevated cars, 100 in number, has been undertaken by an order for a similar number of modern steel cars. Eighty-one buses were added during the year to cover the lines on which bus operation had been started.

This, of course, is only one example, but the case is typical. On other roads it varies in degree but not in kind. Expenditures so made are an object lesson that may well be turned to account by electric railways everywhere. The power to influence of such figures is great when spread on the record, and the public cannot mistake their import in terms of increased service and added comfort. This increased service and this added comfort are not the public's inherent right. It is theirs only by virtue of their use of the service and their willingness to pay a fare that makes it possible to set up adequate depreciation reserves and to finance expansion that calls for the use of new money.

Railways Can Take Lead in Reducing Traffic Congestion

Reduction in cost of operation, increase in revenue and a better position in the community await leadership by electric railways. Intimate knowledge of the present situation, coupled with ability to make necessary engineering analysis, qualifies railway operators to aid solution of baffling community problem

By L. M. Traiser
Special Traffic Engineer Chicago Surface Lines



Mid-block turns on a busy street cause delay to all forms of traffic

RAPID increase in use of motor vehicles has produced a serious traffic situation in American cities. The opportunity which present street conditions offer to public transportation companies to reduce operating costs, increase revenue and build for themselves a better position in the community should induce railway operators to take an active part in helping their communities to work out measures for the relief of street traffic congestion. There is in the present traffic situation both a reason and an opportunity for railway executives to win a position of leadership.

Since every active person in a community must use the streets to carry on business or other activities, traffic dangers and delays are of common interest to all citizens. The cost of doing business, the expense of distribution and, as a result, the cost of living itself have been and are being increased by street traffic congestion. Street railways, earning practically all of their revenue on these streets, are particular sufferers in the form of increased operating costs and revenue losses. In serving their own interests, therefore, they are in the happy position of being able to help in the relief of a most serious and baffling community difficulty.

Traffic congestion not only delays car service directly and increases the cost of operation but it is also the cause of service interruptions caused by the breakdown of other vehicles using the tracks. In Chicago 30 per cent of all street car delays of five minutes or longer are caused by vehicles over which the company has no control. Thus participation in traffic relief work offers many benefits to railway managements.

RAILWAYS PROFIT THROUGH CO-OPERATION

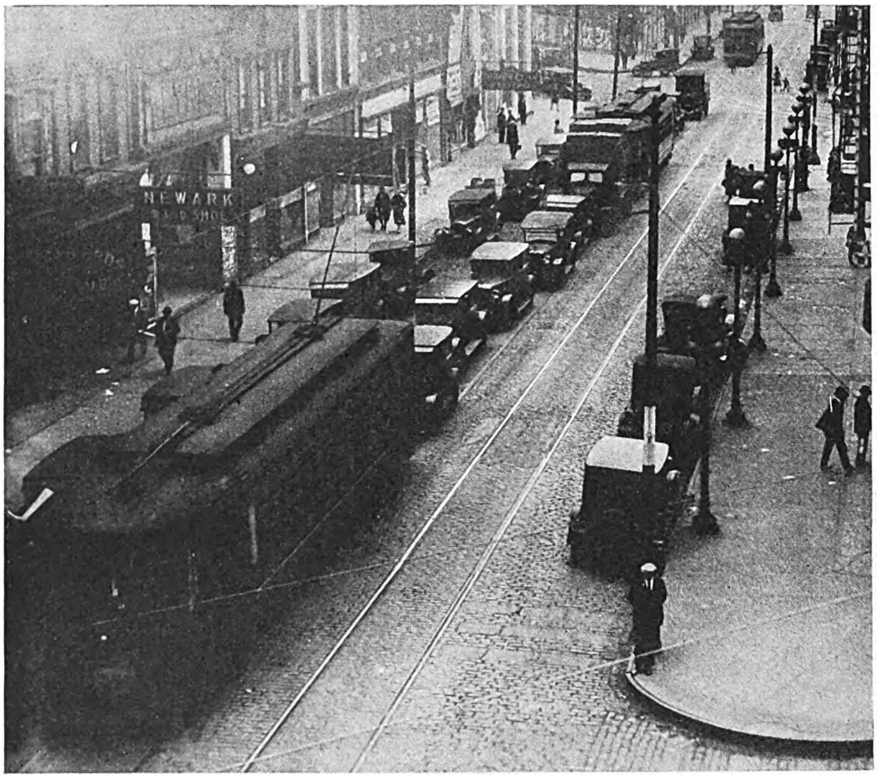
There are not only rising costs and service interruptions to combat but a genuine opportunity to improve the company's position in the community. Co-operation with municipal and civic groups opens to railway operators valuable contacts with leaders in business and civic life on a ground of common interest. Railway executives should be known for leadership. The street traffic situation in most cities offers to them the means of winning such recognition. City-wide knowledge of conditions on principal thoroughfares, in congested districts and at important intersections gives the railway management at once a broad view and authoritative data bearing on regulation and traffic control. Familiarity with traffic speeds, car headways and physical limitations of streets and districts are of great value to civic leaders in conducting intelligent traffic studies.

In working to expedite street car movement railway operators and their engineers have learned fundamentals which can be successfully applied to promote movement and reduce conflict of all street traffic. This intimate knowledge of the situation, coupled with experience which makes them expert in the conduct and analysis of traffic studies, may be profitably capitalized by railway operators.

TRAFFIC SURVEY ESSENTIAL TO INTELLIGENT CONTROL

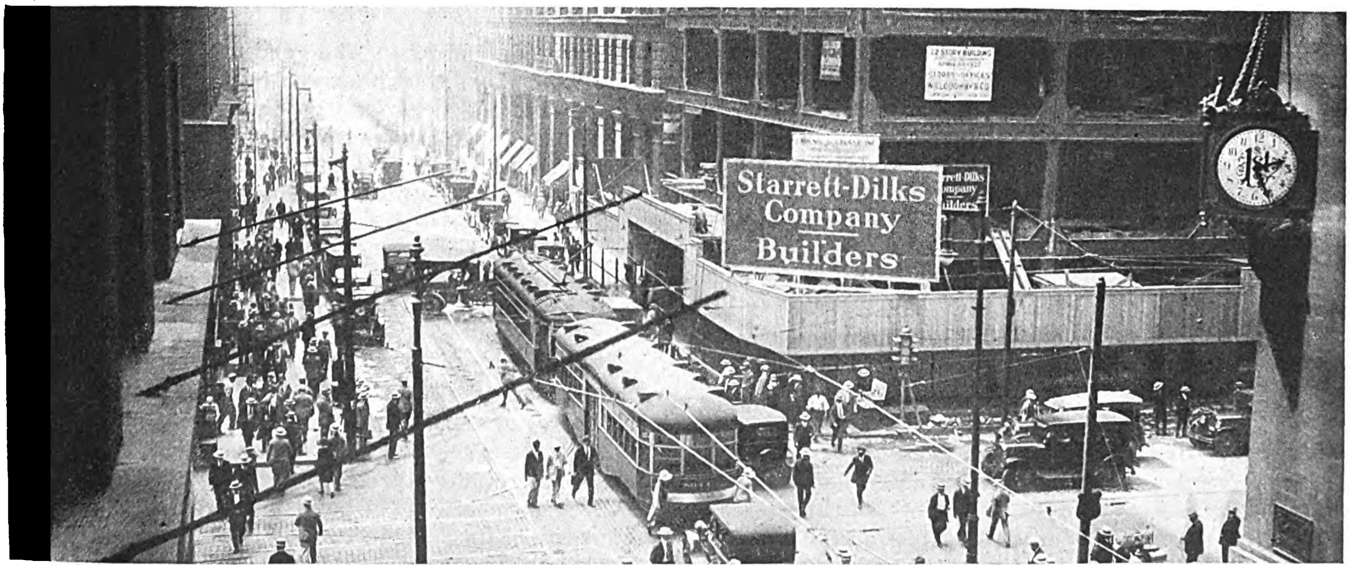
The purpose of traffic surveys should be to collect information and data with regard to the present situation and on this basis to determine means of using the existing street facilities more effectively. Of prime importance in this investigation is the collection and use of facts. Satisfactory traffic control cannot be built upon casual observation or guesswork.

The traffic survey should be city-wide. Congested streets are not limited to any one section. A comprehensive view of the entire community is needed for intelligent relief of congestion. Knowledge of volume and speed of traffic, types of vehicle used and flexibility of movement enjoyed are essential in the study of congested districts and intersections. To this should be added a study of the factors causing congestion. Foremost among these factors will be found: Growth in commercial activities; concentration of industrial and passenger traffic demands in given districts; physical limitations with regard to street space and traffic outlets.



Parking on narrow car line streets forces all traffic onto the tracks and delays car riders

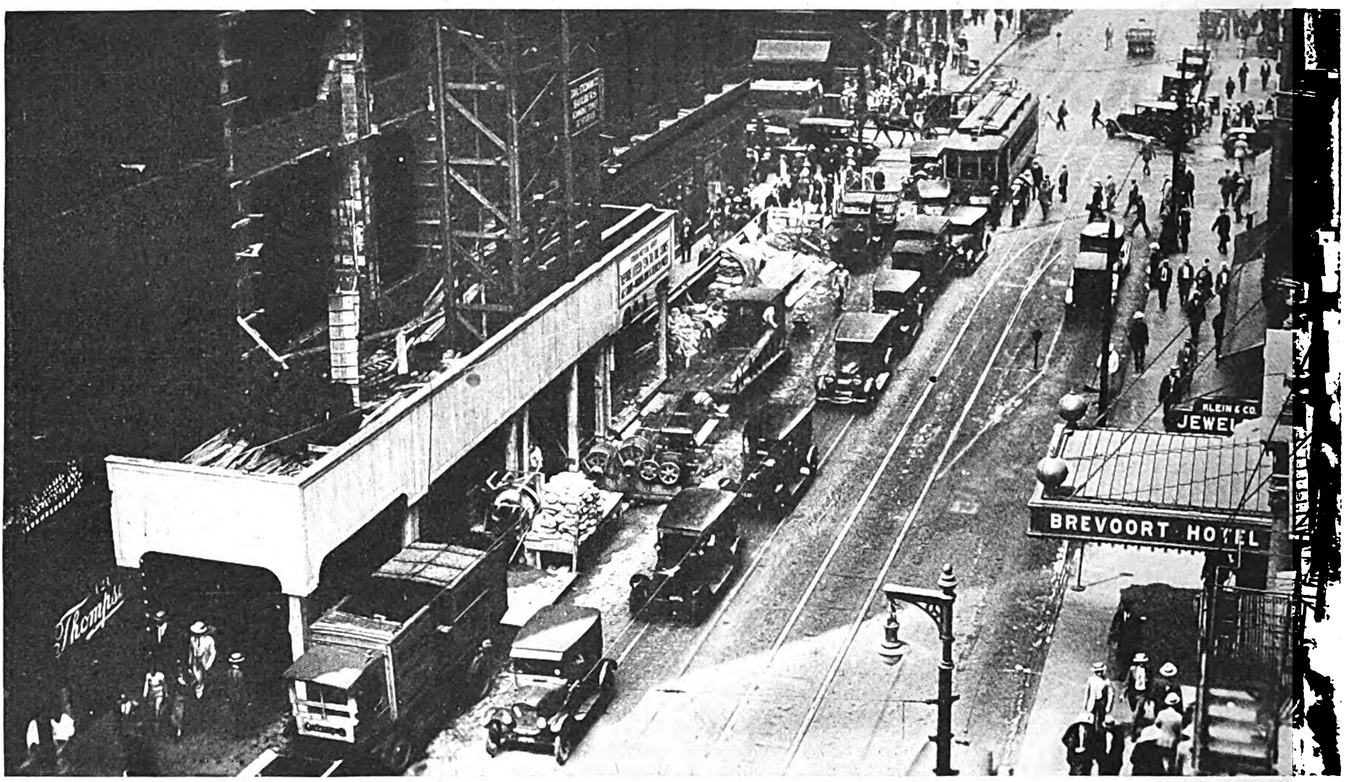
With this information known the second step is the application of this knowledge to bring about increased safety and convenience, while at the same time expediting traffic movement. Flexibility and convenience for the individual should be retained in so far as that is possible without serious delay to the major traffic movements. Investigation often shows, however, that unlimited flexibility and the conveniences represented by left turns, parking or turns within a block serve only a relatively small number of people at the expense of many who must use the streets. In such a situation the rights of the individual must give way to the needs of the community. The traffic regulation policy should be built on the principle of the greatest good to the greatest number.



Unloading building materials during heavy traffic hours is an example of street use which causes serious delay to traffic movement

A fundamental code of street use may be built up on this principle. It will have for its object the reduction of congestion and accidents through co-ordination of traffic movement to reduce friction and interference. This should be set down as a simple, enforceable code of regulations based on traffic requirements and street limitations.

The past five years have witnessed a tremendous increase in the use of traffic signals. Unfortunately, many installations have preceded proper studies of traffic volume and routes. Unnecessary and improperly timed traffic signals have been the result. Investigation of one installation on a heavy car line in Chicago exposed the fact that more than 20 per cent of the time was allotted to a movement of only 1/10 of 1 per cent of the passengers using the intersection. The time wasted by this signal in a single day was tremendous. Where a conflict of heavy traffic movements warrants the installation of signals to increase safety and flexibility they should be fitted to the intersection by a study of the particular traffic to be accommodated.



Use of important thoroughfares for the storage of building materials and hoisting apparatus is a serious obstacle to traffic which causes delay to thousands of people

Probably the greatest advantage of mechanical signal control comes in the progressive movement which can be brought about on heavy traffic streets or in congested districts. This progressive movement obtained with co-ordinated signal control has the obvious advantage over the present widely used synchronized control in that the time allotted to cross movement at each intersection may be in proportion to actual traffic demands at each intersection, instead, as is the case with the synchronized control, of being determined by the volume of traffic at the heaviest intersecting street. Progressive movement of traffic provides a high average speed and a definite check against high crest speeds that makes for safer and more orderly movement. Such a system, similar to one originally developed for the Loop district in Chicago, has been designed on Michigan Avenue to control traffic over 35 intersections covering a distance of more than 3 miles on this important thoroughfare. The installation displaces a synchronized system and is expected to improve materially the average speed and regularity of the traffic stream.

The co-ordinated control of heavy traffic at more than 45 intersections in the central business district of Chicago has been in successful operation for more than a year. In both this and the Michigan Boulevard improvement engineers of the Chicago Surface Lines suggested the method of control to be used and worked out the details of signal timing. Close co-operation in the work of improving conditions in the city has made the street railway one of the leaders in bringing about traffic relief in Chicago. The good will and public confidence which have thus been won insure continuation of the policy of co-operation that has been established. Thus the car rider is given proper consideration in the regulation of traffic and at the same time street conditions have been improved despite a constantly mounting traffic volume. There are situations in every city where better street traffic conditions will result from intelligent relief measures. In this work the street railway will do well to take an active part.

The city of Coral Gables, Coral Gables, Fla., through its engineering department, is drawing up plans for the building of a carhouse to house the cars of the rapid transit lines recently turned over to the city for operation. The carhouse will be built, if approved by the City Commission at its July meeting, in the industrial section in block 12. The construction will be of concrete block about 40 x 150 ft. E. Friedman, chief engineer for the city, is handling the plans.

German Road Makes Progress*

Proposed Rhenish-Westphalian high-speed line will have approximate length of 115 miles. The main line will serve nine cities and several branches are proposed

By W. Cauer
Director of Engineering, Professor at the Technical High School,
Berlin, Germany

DESIRE to give a high-speed connection between several of the principal industrial cities in the famous Ruhr district of Germany has led to plans for an electric railway that will provide frequent service with running time between the terminal cities about half that required by the State railway.

The project is not a new one. The first plan was made in 1904 for an interurban railroad from Cologne to Düsseldorf. The second project was for an interurban line between Düsseldorf and Dortmund. This project was worked out by order of a union of the towns in 1909 and provided for an electric line running on its own right-of-way and passing populated districts without entering the streets. The plan was rejected in 1911 by the Prussian Minister of Public Works as being an encroachment on the monopolized rights of the State railway, which would be able to cope with the traffic quite by itself by enlarging its existing system.

Due to the increased difficulties of handling passenger traffic after the war, all towns from Cologne to Dortmund combined again in 1920, in conjunction with the Rhenish-Westphalian Electric Company, to further a plan for an interurban railway from Cologne to Dortmund. In 1921 the State railway administration of Essen commented favorably on the plan of building a rapid transit railroad independent of the State railway system. By order of the town the Rhenish-Westphalian Electric Company worked out a preliminary plan, with the result that in 1922 the general preliminary design was submitted and a franchise to build the railroad was asked for. In January, 1924, the Prussian Government, with the consent of the German Empire, granted a 99-year concession for building and operating the rapid transit railroad system.

The time allowed for raising the joint capital stock and for the formation of the railroad company was two years. The main line plan was examined in detail. Estimates were made of building costs and the profits that could be expected. In view of the unfavorable economic conditions, an application was made for a three-year extension of the time limit to January, 1929, which was granted by the Prussian Board of Trade. The total capital required is 340,000,000 reichmarks.

The present plan covers a main line connecting the towns of Cologne, Düsseldorf, Duisburg, Mülheim, Essen, Gelsenkirchen, Bochum, Langendreer and Dortmund. A line between Duisburg and Essen by way of Oberhausen is also planned. Details of the branch line Duisburg-Hamborn-Dinslaken, Duisburg-Moers and Essen-Gladbeck are not yet settled, nor are the intermediate stations finally decided. The Essen-Gladbeck line will have to make a large number of stops as it has to compete against an existing tram line.

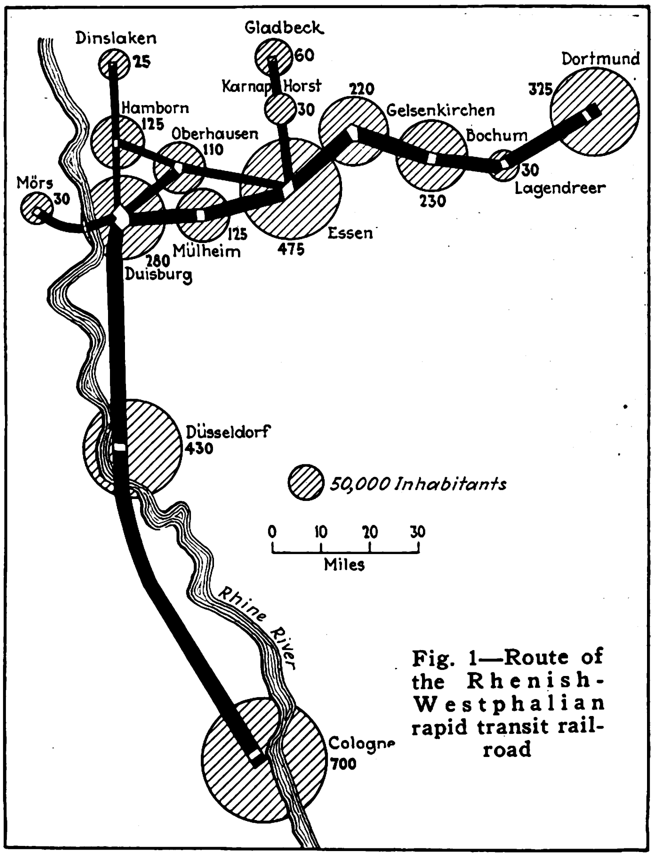


Fig. 1—Route of the Rhenish-Westphalian rapid transit railroad

All of the main line stations are placed in the business centers and, except in Düsseldorf and Bochum, the sites are close to the State railway stations. In general the stations are to be of simple design. At Duisburg, the junction of several lines, there will be a depot annex and a repair shop.

The main line will be built first. Between Cologne and Duisburg the maximum speed will be 81 m.p.h. and on the sections further east it will be 61 m.p.h. On the average, trips made will take only half the time neces-

sary to travel by the State railway. The whole journey from one end of the main line to the other will take less than 1½ hours. During off-peak periods trains will run at half-hourly intervals. This will be decreased considerably for rush-hour service.

To meet various traffic conditions long and short trains will alternate, spaced at varying headways. It is expected that service on branch lines will consist of short trains run at frequent intervals.

To provide a maximum schedule speed, all cars of a train will be motor cars. The shortest train is to consist of two cars. Each car will be 69 ft. 3 in. long, mounted on two trucks. The ends of the leading cars of a train are to be rounded to reduce wind resistance. Trains can be lengthened by adding intermediate cars with square ends up to a total of six cars. Stations and platforms are to be held in corresponding proportions. Each car will provide for a seated and standing load of about 200 passengers, according to the accompanying table. The power will be supplied to an overhead trolley at 1,500 volts direct current, transformed down from alternating current at 25,000 volts at substations and converted by means of mercury-arc rectifiers.

The track will be of modern heavy type, similar to that adopted by the State railway. Due to the high speed at which trains will run, all curves in the open country are to have a radius of not less than 3,280 ft. Fig. 2 shows a clearance diagram for the new line at the highest and lowest positions of the overhead wire. Fig. 4 gives a comparison between the rapid transit railroad clearance diagram at the lowest position of the overhead wire and the corresponding diagram of the State railway.

Crossing of roads and streets at grade will be avoided. In the open country the line will run as far as possible on embankments or through cuts. Inside towns it will be necessary to run underground.

In the Ruhr coal mining district lines must neither run through subways nor through tunnels, so the tracks will be elevated on an earth fill supported by retaining walls. Streets and plazas are to be crossed by bridges. All bridges within this area will be built with separate structures for each track so that it will be possible to repair tracks independently of each other.

The automatic block signal system adopted will employ three-position daylight signals which are visible even in foggy weather at great distances. Automatic safety stops will be provided to engage the brake mechanism if the train passes the signal in stop position. Besides this, at the approach to the terminals the train speeds will be reduced automatically. Other safety measures are provided by the use of three independent brake mechanisms. These are an air brake, a dynamic brake and a handbrake. If a motorman releases the dead man handle, an emergency brake application is automatically applied. Passengers also can stop the train by means of an emergency brake cord.

New cars of this type have been of great advantage in holding the revenue of the rail lines in Portsmouth, Ohio

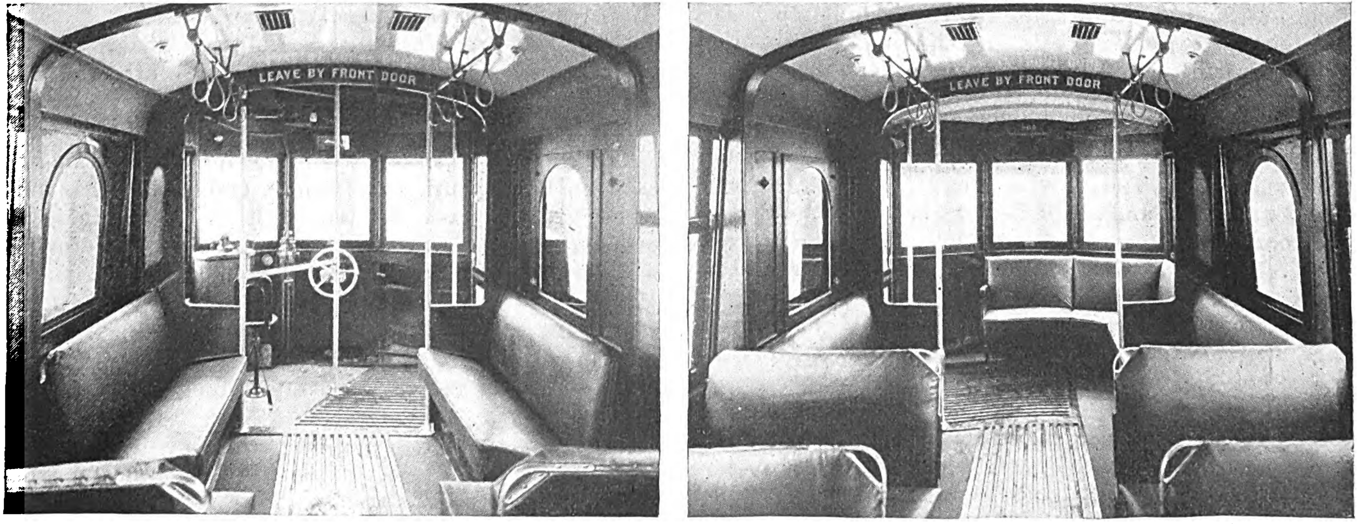
Co-ordination in Portsmouth, Ohio

Modern cars and buses have increased the total revenue of the Portsmouth Public Service Company in the face of automobile and independent bus competition

MEETING modern conditions in a city of 50,000 population is a matter of considerable difficulty. The automobile has made so many inroads on revenue that even the most-talked-of plans have to be worked out with care to accomplish the salvage of the transportation property. Conditions in Portsmouth, Ohio, during the past several years have been similar to those in many cities of like size. With the use of new cars designed to meet the conditions of today, supplemented by bus service where it can be effective, the Portsmouth Public Service Company has been able not only to remain in operation but actually to increase the number of riders on its lines.

The company began modernization of its equipment in June, 1920, when six cars built by the Cincinnati Car Company were placed in service on one of the heaviest routes in the city. Three more of the same general type were installed in February and March, 1924. These nine cars give about 80 per cent of the local service, which takes altogether twenty city cars. A total of 1,580 car-miles per day was operated in 1926, at an average cost of about 39 cents per car-mile for all types of equipment.

The management is well pleased with the cars. They are light and have sufficient motor capacity so that they accelerate and retard quickly. Tests show that they are economical of power. The route is approximately 11 miles long, with light grades and good operating conditions. The tracks are on the heaviest traffic streets of the city.



The cars have a pleasing interior. At left, looking toward the front; at right, a curved seat gives comfortable accommodations in the rear of the car

The city railway service is now augmented by bus lines, as shown on the accompanying map. The first of these lines was started on Nov. 1, 1925. Bus service was inaugurated originally to care for a number of outlying residential districts that were not served adequately but did not have sufficient population to warrant the construction of car lines. At first two bus lines with a total length of about 5 route-miles were run into the northern part of the city. Following discussions with city officials during 1926, railway service was discontinued on the Sixth Street car line, consisting of about 1.83 miles, and on the Seventeenth Street line, about 1.84 miles, a total of about 3.67 miles of track, and bus service was started as a substitute.

Above—Bus routes have been used to replace some unprofitable car lines in Portsmouth, Ohio. At left—Placard advertising interurban service to Huntington, W. Va.

The buses do not run exactly over the former street car routes, as may be seen from the map. The total length of the bus routes today constitutes about 9.5 miles.

The regular schedule calls for half-hourly service on each bus route, with a total of 688 bus-miles per day. The city railway service is on ten-minute headway in the base hours, with five-minute headways in the rush.

The cash fare is 10 cents, with five tickets for 35 cents and 60 tickets for $3. The average fare is slightly under 7 cents. In 1921 the railway passengers per day averaged 9,100. Today, with greatly increased automobile competition and a number of bus lines operated by the company, the average is 8,200. According to company officials, the decrease would have been much greater had it not been for the installation of the new cars.

The fare on the buses is the same as that on the cars, the same tickets being used. Free transfers are issued between all lines, both car and bus. The average number of bus passengers daily is 2,700, so that the total riding of the system, 10,900 per day, is considerably more than it was in 1921, prior to the introduction of the new cars and the buses.

There is an agreement between the company and the city that the street car lines will not be abandoned permanently, but are only discontinued. The rails and overhead are retained in position, so that rail service can be resumed at any time it is mutually agreed between the city and company to do so.

Besides the city service, the company operates a bus line from Portsmouth to Wheelersburg, a town of some 500 inhabitants at a distance of 10 miles. The route runs over the main highway between Portsmouth and Ironton as far as Wheelersburg and it averages 277 bus-miles per day on an hourly headway and carries an average of over 1,300 passengers daily. Two buses are used to fill the schedule, averaging fourteen trips a day.

Fares are collected on the zone system. There are four zones, the fares charged being the same as those on the city lines, with the exception that the cash fare is 10 cents in the first zone and 5 cents in succeeding zones, or 25 cents cash for the entire distance. Cleveland locked fare boxes are used on these buses and on the city cars, while Ohmer registers are used on the city buses and on the interurban cars.

The buses are Whites with Kulhman bodies and all of them are equipped with Westinghouse air brakes.

INTERURBAN MEETS BUS COMPETITION

The company operates a 30-mile interurban rail line between Portsmouth and Ironton, Ohio, which has suffered greatly from bus competition. The line was projected in 1902, and was built as far as Sciotoville, now within the city limits of Portsmouth, in 1903. It was extended to Ironton and service was begun in 1916. The cars run every hour on the hour from Portsmouth, the time being one hour 18 minutes. After a four-minute layover the cars leave Ironton at 22 minutes past the hour.

There are two competing bus lines, one of them running half-hourly service between Portsmouth and Ironton. These two lines were cutting seriously into the revenues of the interurban, reducing the net earnings of the company accordingly. As a remedy it was decided to make a cut in fares and the rate was reduced from 90 cents to 75 cents. This was followed by a 60 per cent increase in gross revenue. The result was so satisfactory that a further cut to 50 cents was decided on. This produced another increase in gross business of 23 per cent.

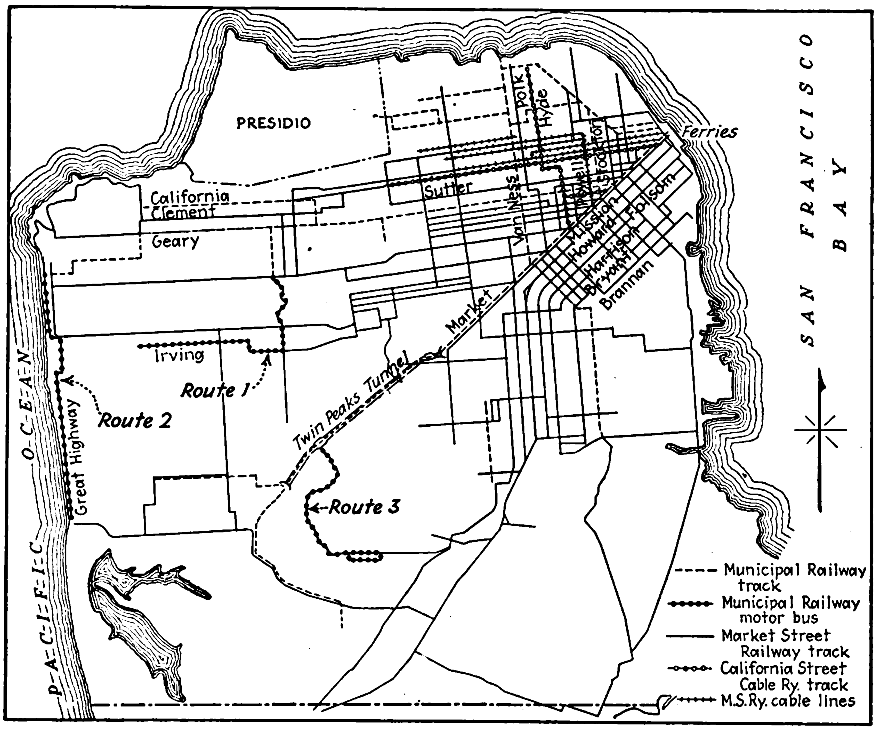
Prior to the reduction in fares, the bus lines had been carrying more passengers than the railway. Traffic checks taken at various points before and after the change showed that conditions were reversed following the reduction. The shift in riding was not confined to any one class, but affected both long haul and short haul in about the same proportion. The checks showed that the bus competitors are now working at a load factor which precludes any possibility of profit.

By co-ordinating with the Ohio Valley Bus company, a through service is rendered between Portsmouth and Huntington, W. Va., the buses furnishing the transportation between the latter city and Ironton, a distance of 22 miles. Schedules are co-ordinated so that close connections are made at Ironton. One of the advertising placards reproduced herewith shows how the through service has been featured. Combined with the low fare on the interurban, this joint service has been a material element in reducing competition.

Buses Operated in Feeder Service

Municipal Railway of San Francisco is using buses to augment rail lines in several districts where extension of tracks would not be justified

FEEDER and extension bus service is operated by the Municipal Railway of San Francisco to tap sections of the city unserved by rail lines of either the Municipal Railway or the Market Street Railway. Such service, however, is co-ordinated with the Municipal Railway and in no way competes with it or the Market Street Railway. Because of the very nature of the routes covered by the buses, the operation as a whole showed for last year a net loss amounting to approximately 7 cents per bus-mile. This loss is not viewed with any degree of concern by the management, because additions have been made to original bus routes so that they now render transportation service far in advance of the requirements. Moreover, bus operation serves as an indication of the need for transportation in a section of the city, and even now it is planned to replace a portion of one of the bus routes with rail service.



Bus routes of the Municipal Railway of San Francisco traverse sections of the city unserved by rail lines of either the Municipal Railway or the Market Street Railway

Three bus routes are operated, requiring thirteen buses. During the fiscal year ended June 30, 1926, the passenger revenue derived from these three routes amounted to $53,467. In addition to the passenger revenue obtained directly by the bus operation, a credit of 2½ cents is made on transfers originating on the street cars. This, together with school tickets and other revenue credits, amounted to $19,432, which brought the total passenger revenue and credits for the year up to $72,899. The operating expenses for the 449,886 bus-miles operated amounted to $105,945, resulting in a net loss for the year of $33,046, or 7.35 cents per bus-mile operated.

Bus service can be divided into two classes. First, feeders to the rail lines and, second, local or sightseeing routes along the Great Highway adjacent to the beach and amusement resorts. Under the first classification are routes Nos. 1 and 3, the former producing a direct passenger revenue of $27,691, constituting the most profitable of the bus lines, a portion of which is to be replaced by a rail line. Under the second classification is route No. 2, whose operation resulted in a passenger revenue of $20,836 for the year. This route, located as it is at western terminals of lines of both the Municipal Railway and the Market Street Railway, and covering the entire length of the beach for a distance of 2.75 miles, renders a local service in addition to feeding the rail lines. On Sundays and holidays the amount of local service requires five buses operating on approxi-

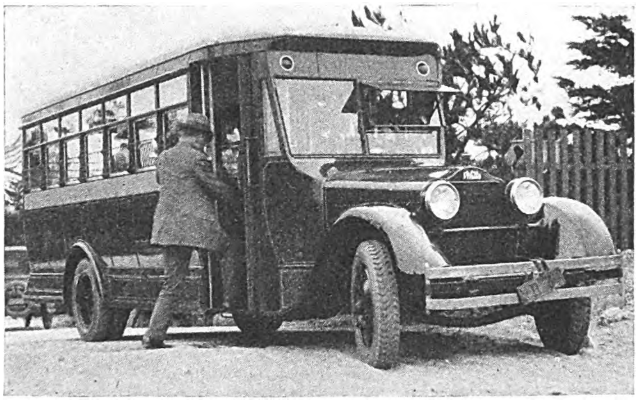
mately a seven-minute headway, and at times the traffic becomes so heavy that no reasonable amount of equipment could handle it. On week days, however, the traffic is light, requiring two buses to give a fifteen-minute service. On Sundays and holidays a revenue as high as $160 is obtained from this operation.

Routes and service of the Municipal Railway bus operation are given in Table I.



Buses of the street car type are used by the Municipal Railway in both feeder and extension service to its railway lines

A statement of the bus line operations for the month of November, 1926, is given herewith. This indicates the method used by the Municipal Railway for setting up the itemized cost per mile for bus operation.

Depreciation on the bus equipment is figured at 2 cents per bus-mile. This is an average figured over the entire equipment, which includes some old buses that have operated in the neighborhood of 300,000 miles and are still used in tripper and extra service. The rate of depreciation is changed monthly so that a fair balance is reached in order to write off the equipment as it wears out.

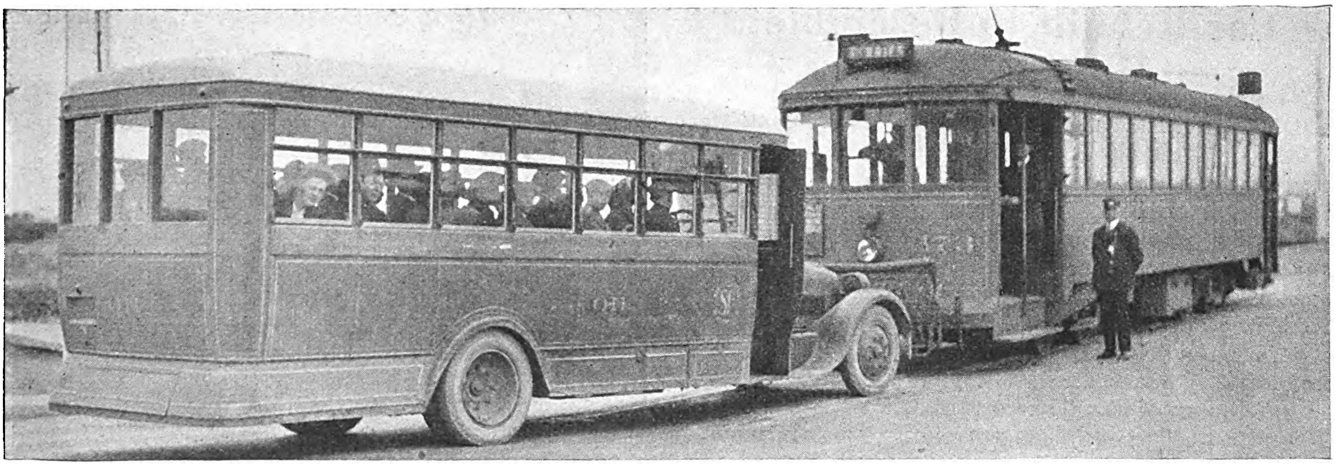
The detailed description of the bus equipment is given in Table II.

The ten buses purchased by the city are of several types, although all are of White manufacture. All are pay-as-you-enter. There are five TDS buses, weighing 7,800 lb. each, and seating eighteen passengers; two type 20-45 of the same capacity and weight, and three type 50-a, weighing about 10,000 lb. each and seating 25 passengers.

In addition the railway operates three Pierce-Arrow 29-passenger buses which were donated by a community and which are carried in the capital account under contributed surplus at $24,000. The operating expenses, however, are included in the general statement.

Many requests have been made for municipal bus line service connecting with the street cars, and recommendations have been made by M. M. O'Shaughnessy, city engineer, to inaugurate service on five new routes, St. Francis Wood, Balboa Terrace, Westwood Highlands, Westwood Park and the westerly portion of the Sunnyside Tract. All are closely built up portions of the city and are somewhat remote from street railway lines. The contour of the ground is such as to make it costly to construct and operate a street railway, although a bus easily could be operated to connect with the railway. A petition for this bus line signed by 600 residents of these districts was recently presented to the municipal authorities. The proposed route is 1.25 miles long. To provide service for this route an expenditure of $40,000 for equipment would be required.

For almost ten years the matter of transportation for the Potrero Hill District has been under consideration. A new street between Rhode Island and Carolina



Buses operated by the Municipal Railway of San Francisco meet rail cars at the line terminals and carry passengers into sections of the city not otherwise served

Streets is now under construction, and when this is completed a bus line connecting with the Potrero Avenue car line of the Municipal Railway is proposed to operate over Seventeenth, San Bruno, Vermont, Twentieth, Twenty-second, and Wisconsin Streets, to 23d Street. The length of this line would be 1.10 miles, and the cost of equipment is estimated at $30,000.

Another recommendation of the city engineer concerns bus service around the waterfront. The length of such a line would be 3.25 miles. The cost of the equipment necessary for its operation would be $60,000. In Lincoln Park the Legion of Honor Building has recently been opened. No direct car service is within easy reach of this building, which is being daily visited by many people. Service would be given by a bus line operating from 33d Avenue and Geary Street, via 34th Avenue and Lincoln Park. The length of this line would be 0.6 mile, the cost of the equipment $10,000.

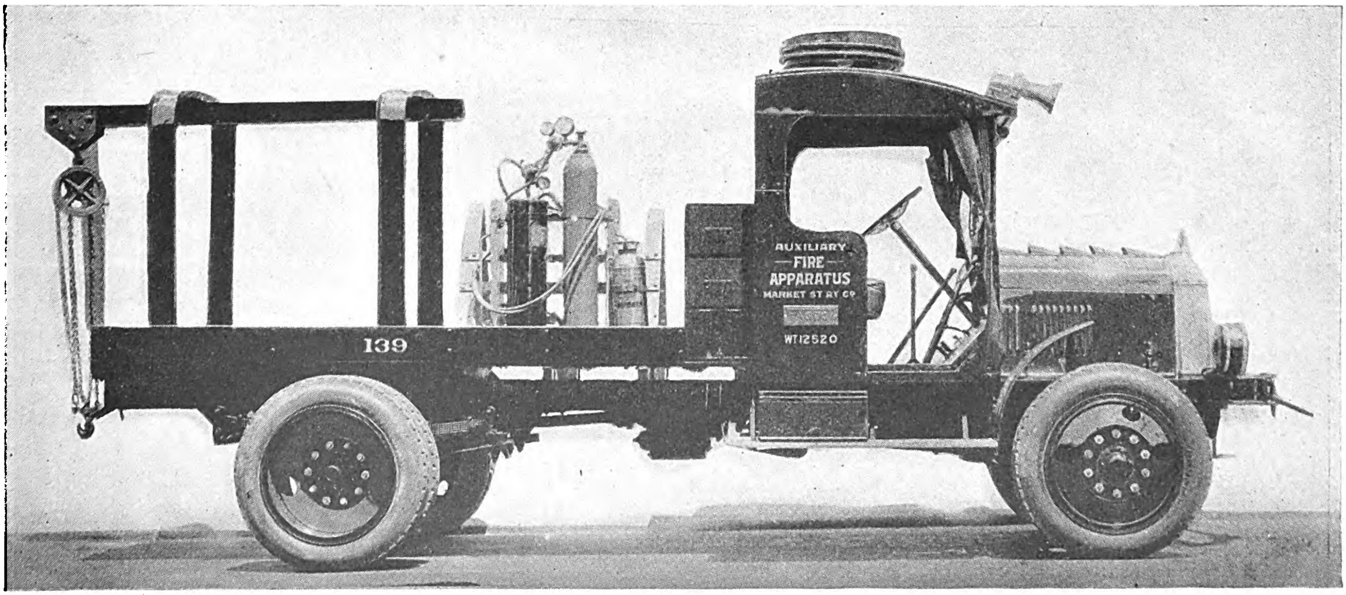
At the present time the vast area lying between Bruno Avenue and Mission Street is without any form of transportation. After the completion of the Excelsior District railway line, as now planned, a bus line would be operated over Silver Avenue from Mission Street to San Bruno Avenue. Its length would be 1.47 miles and the cost of equipment would be $30,000.

Railway Operates Auxiliary Fire Apparatus

VALUABLE service is being given by an auxiliary fire truck built in the shops of the Market Street Railway, San Francisco. It is housed at the Ferry Building and is always on call. Assistance is rendered to the city's Fire Department from time to time. It is equipped with a fire siren and is given the right of way over ordinary street traffic.

From time to time stalled trucks are towed out of the vehicular tunnel, which extends across the foot of Market Street near the ferries. For this purpose the truck is equipped with two drawbars, one at the front and the other at the rear, enabling it to hitch at either end onto a disabled vehicle. The truck also carries a specially built acetylene torch outfit capable of cutting through heavy girders in a few minutes. On the right-hand side of the body is a towing dolly. Over the driver's compartment is a spare tire. Other equipment carried includes fire extinguishers, wire rope, blocks, jacks, etc.

At the rear is a chain hoist capable of lifting a heavy truck. The body is mounted on a Fageol chassis equipped with pneumatic tires.



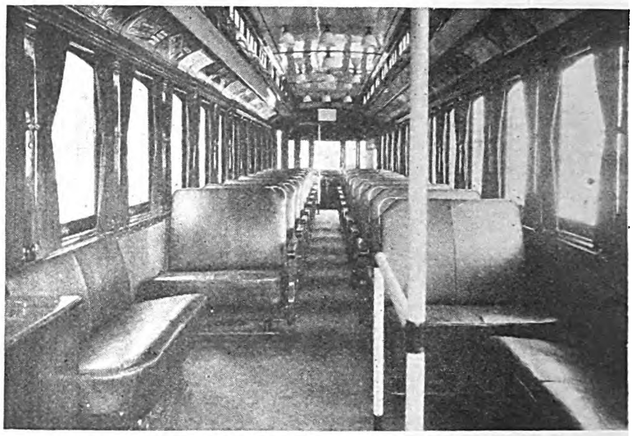
Emergency truck operated by the Market Street Railway of San Francisco is equipped for fire-fighting and wrecking activities

Car Rebuilt to Resemble Motor Coach

CONFRONTED with the problem of increasing the through riding on the 14-mile interurban line operating between New Bedford and Fall River, the Union Street Railway, New Bedford, Mass., recently remodeled a passenger car to resemble a bus. This company has for some time supplied duplicate service between the two cities, as its New Bedford-Fall River-Providence bus route parallels the electric railway line between New Bedford and Fall River. Each class of service has a 30-minute headway, the car making the run in 60 minutes at a 30-cent fare, while the bus takes 45 minutes, collecting a 50-cent fare. The car makes suburban stops en route, while the bus operates express service from city to city. Because a considerable number of passengers seem to prefer the trolley to the bus, it was thought advisable to encourage this class of patronage by operating a de luxe passenger car.

The modern motor coach was used as a model for the interior finish of the de luxe car and it was found that the car presented even more opportunity for finished workmanship than does the motor coach. The existing electrical and mechanical equipment was found to be in excellent condition, making it possible to rebuild the car at a cost of 10 per cent that of new equipment.

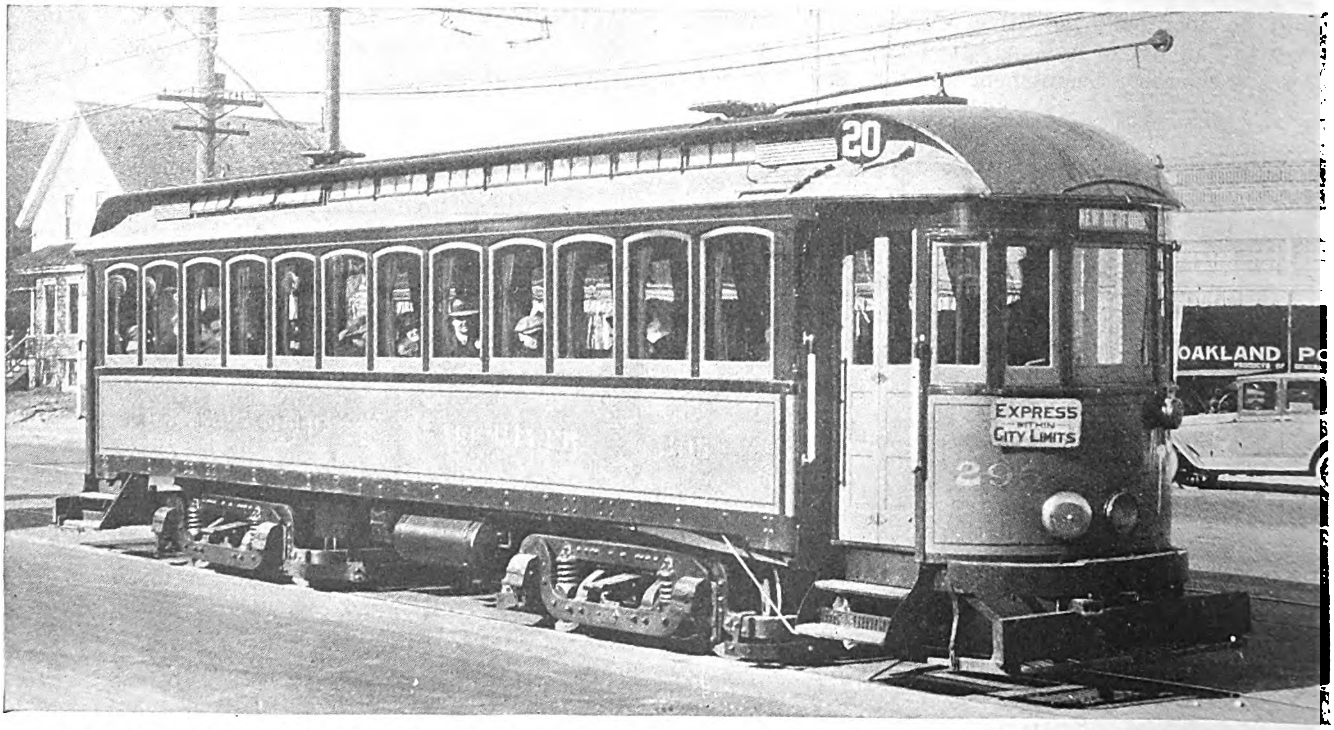
Exterior colorings were changed from Pullman green with gold lettering and striping to a tan and brown coloring (Mojave gray and London smoke) with gold lettering and orange striping. Exterior wooden grab handles were replaced by steel pipes, covered with white enamel. Vestibule doors were installed. To give an unobstructed view ahead, the bulkheads at either end of the car were removed and the platforms of the car finished attractively. Battleship linoleum was laid over the old wood floors. Side walls under the windows were covered with a heavy gray tapestry, similar to that customarily used in modern motor coaches. The ordinary street car window curtains were replaced by drapery curtains, held in place by horizontal nickel-plated rods and tie-back snaps. Natural finish ceilings were changed to white enamel with gold striping.



The interior has been refitted along the lines of current automotive practice

Reversible seats are required on this line on account of double-end operation. The seating capacity was not changed, but the rattan covered seats were replaced by air cushion seats, covered with heavy brown leather. Rearrangement of the seats made it possible to build sand boxes in the corners of the car, thus eliminating the necessity of removing a seat top in order to replenish the supply of sand. The lighting system was not changed, although 56-watt lamps replaced 23-watt lamps. The monitor window glasses were changed from amber to white frosted glass, so as to harmonize with the white enameled ceilings.

Only one car has been rebuilt. The success or failure of this piece of equipment will probably aid in determining further developments. The car has not been in service long enough to determine definitely what results will be obtained. A good indication of its popularity is that the company information office is continually asked by patrons what time they will be able to ride on "the de luxe car."



Popularity of this rebuilt interurban car operated by the Union Street Railway on the New Bedford-Fall River route is indicated by the number of inquiries concerning its time of departure

Operating Efficiency Raised Through the Merit System

Systematic administration of discipline, coupled with awards for good records and further bonuses for especially meritorious service, has proved popular with management and men in Los Angeles

IN A CITY where the ratio of population to automobiles is approximately two to one the problems of a street railway property are many. Add to this the difficulty of keeping on an even keel financially with a 5-cent fare and the solution of operating problems becomes more complicated.

Such is the situation in Los Angeles, where the Los Angeles Railway renders extensive city service under conditions far from what would be termed favorable. Efficient performance of shops, equipment and substations and modern track and roadbed have had their collective effect in assisting in the successful operation of the property. However, a large share of the success, according to the management, is attributable to the transportation department—2,700 platform men who on this particular property act as salesmen of transportation. It is this sales effort that has resulted in increased patronage from a public where every other individual is able to ride in an automobile of his own.

MERIT AND BONUS SYSTEM FOR 1927

Under New Plan a Much Larger Number of Men Will Participate in Special Awards

The Merit and Bonus System will be continued for 1927, operating under the following plan:

$5.00 PER MONTH

The management sets aside $5.00 per month per man for all men engaged in passenger car service six

same offense during the past or present bonus year, the penalty will be from 25 demerits to removal from the service.

This will apply particularly to discourtesy and such rules as are printed in caps in published classification of demerits.

CLASSIFICATION LIST OF FISCAL YEAR December 1, 1926 to December 1, 1927

LIST OF CAUSES FOR DEMERITS

1. DISCOURTESY.
2. COLLISION OF CARS; COLLISION WITH VEHICLE OR PERSON.
3. Blocking traffic.
4. STEP ACCIDENT.
5. DERAILING CAR OR SPLITTING

23. LAXITY IN CALLING STREETS.
24. LEAVING CAR UNATTENDED.
25. NOT BEING STATIONED BY FAREBOX.
26. OPENING EXIT GATE TOO SOON.
27. MISSING OUT OR MISSING RELIEF.

The successful operation of the Los Angeles Railway is based 90 per cent upon the efficiency of the men who man the cars

Trainmen work under what is known as the merit and bonus system, but which, in effect, is an efficiency plan based upon the principle that a man is rewarded with additional compensation for rendering service which is 100 per cent perfect. A bonus of $5 per month is paid to each man for giving safe and courteous service and a 100 per cent performance. In addition to this $60 a year, those whose records warrant it are entitled to additional awards, the maximum of which for the year 1927 per man will be $40. These additional awards are available to all trainmen who have perfect records, so the bonus for a large number will amount to $100 a year. However, service which is not meritorious is not rewarded, deductions being made from the $5 a month bonus for infraction of rules or established regulations.

In the application of the merit system to this property no attempt has been made to tie it down entirely to the claims department work in the prevention of accidents. Safety is only one of many factors entering into the plan. Courtesy is on a par with safety. It has been the aim of the management in establishing this system to better public relations, thereby gaining good will by improving its own relations with its train-

men. This effort has resulted in a personnel of satisfied salesmen.

To the company this system means an extra annual expenditure of approximately $125,000. The return from this expenditure cannot be measured exactly. However, one factor stands out above all others. It is recognized by those familiar with both the operating and financial status of the company, namely, that the good will of the public obtained through courteous service on the part of the trainmen has resulted in increased riding. This has made possible the operation of the lines on a 5-cent fare. Another tangible result of the system has been the noticeable reduction in accidents and also the reduction in claims. The first is attributable to safe operation, the second to the establishment of better public relations.

From the time a man enters the service of the transportation department a record is kept of his efficiency. This record card is made out annually by the merit department. It determines whether a man is entitled to the full bonus for each month or a portion of it.

Efficiency record cards are kept in the department office and filled out monthly, or at such time as the man receives a demerit or credit for his efficient or inefficient service. If entitled to it, the trainman also receives credit at the end of each month for safe and courteous operation. The award of credits or the allocation of demerits, with the exception of fixed cases where the case itself determines, and the number to be awarded or subtracted are in the hands of the supervisor of merits. This arrangement has proved more satisfactory than the previous arrangement whereby the division superintendent made the award or gave a demerit.

CAUSES FOR DEMERITS

A list of demerits has been set up by the department and contains 40 classifications, under any one of which a trainman may receive demerits. Each man is judged separately as to whether he is entitled to credit or demerit. Inefficient operation on the part of the motorman does not necessarily affect the record of the conductor. The same holds true in regard to the motorman's record. The accompanying list of causes for demerit has been set up under the 1927 plan.

It will be noted that some classifications of demerit have more prominence in the table than others. Under the rules for the ensuing year, where it is found necessary to assess demerits against a man who has been previously demerited for the same offense during the past or present bonus year, the penalty will be from 25 demerits to removal from service. This will apply particularly to disregard of such rules as are printed in heavy type in the classification. Demerits are assessed on recommendation of division superintendents, supervisors, instructors, safety men and others in authority. All reports on which demerits are based are checked in the main office by the supervisor of the merit system before being entered on the record and forwarded to the division superintendent.

Deductions from the bonus are made at the rate of 25 cents for each five demerits assessed (five demerits equal 1 per cent), regardless of previous efficiency as shown on the record. When a man's efficiency rating drops below 75 per cent he is subject to automatic dismissal from the service. However, dismissal from service for other offenses may be made regardless of the efficiency rating.

Ten credits are allowed each month for a clear courtesy record and ten credits for a clear accident record. As was previously stated, these credits are given automatically.

Demerits are canceled from a man's record only in case of an error in report or extenuating circumstances, which must be explained to the satisfaction of the supervisor of the merit system. Appeals from demerits assessed must be made within 30 days, first to the division superintendent and second to the supervisor of the merit system.

To establish a man's efficiency rating, which is upon a percentage basis, each five credits or demerits counts for 1 per cent. Thus, if a man's record is perfect for the month for both courtesy and safety and he has received neither demerits nor credits his efficiency rating would be raised 4 per cent. At the end of a year his efficiency record should be 148 per cent. With the possibility of a 148 per cent rating for courtesy and safe operation, the figure 75 per cent, which is about one-half of this amount, should warrant dismissal from the service.

Each year since the inauguration of the merit and bonus system, in 1920, there has been a gradual tightening up on the men, a stricter enforcing of discipline and the subsequent changing of the number of demerits

Classification List for Fiscal Year Dec. 1, 1926, to Dec. 1, 1927

LIST OF CAUSES FOR DEMERITS

1. **Discourtesy.**
2. **Collision of cars; collision with vehicle or person.**
3. Blocking traffic.
4. **Step accident.**
5. **Derailing car or splitting switch.**
6. Bending or breaking trolley pole, or operating against same.
7. Carrying passengers past destination.
8. Passing up passengers.
9. **Failing to report accident.**
10. **Doubling electric switch.**
11. **Excessive speed.**
12. **Running ahead of time.**
13. **Dangerous operation.**
14. Errors on cards and trip sheets.
15. **Remaining seated while passengers boarded or alighted.**
16. Failing to have watch inspected.
17. **Giving bells too soon, or with back to steps.**
18. Going against traffic signal.
19. **Failing to make safety stop.**
20. **Leaving terminal late.**

*21. Improper operation or flagging at railroad crossing. (Special rule).

22. Improperly equipping car. (Dash sign, T. R. No., or lights).
23. **Laxity in calling streets.**
24. **Leaving car unattended.**
25. **Not being stationed by farebox.**
26. **Opening exit gate too soon.**
27. **Missing out or missing relief.**
28. **Absent from duty without permission.**
29. Reading newspaper.
30. **Starting car too soon, or without bells.**
31. **Violating road space.**
32. Smoking while on car.
33. **Remaining seated on stool in zone 1.**
34. **Failing to sound gong at dangerous street or when starting up.**
35. **Visiting with motorman or riding front section.**
36. **Improper feeding of controller, or abusing equipment.**
37. **Wasting power.**
38. Failing to report accident or delay promptly or to dispatcher.
39. Unnecessary conversation.
40. Miscellaneous.

CREDITS

No classifications.

*Note: Penalty for same: Sent to instruction department one day without pay.

given for certain offenses. Now a high percentage rating does not prevent a man from losing part of his bonus for being demerited during the month. Thus the illustration of the efficiency record card of R. P. Andrews shows that he received only $4 of his bonus for the month of December, the first month in the fiscal year of the bonus plan. He received twenty demerits during the month, which amounted to $1. In addition to the standing credit for courtesy and safety, there is also a standard demerit for loss of time. This amounts to 16⅔ cents for each day out of service over the five per month allowed each man. This deduction in bonus is not recorded as so many demerits on the efficiency record. It does not affect the percentage standing.

Los Angeles Railway

1. The following three examples give the leaving time at the terminals and the number of minutes running time between intermediate time points. In each case, what time would you arrive at the other end of the line?

Leaving at 9:53 a.m. Min.	Leaving at 10:59 a.m. Min.	Leaving 11:43½ p.m. Min.
7	9½	7½
8½	8	4½
9½	5½	9½
11½	7½	7
7½	13½	8½
9	8	15½
...	9½	7½
Arrive at...........	Arrive at...........	Arrive at...........

2. If you started to work at 7:59 a.m., and were relieved at 1:53 p.m., and resumed duty again at 2:39 p.m., and completed your run at 6:29 p.m., how much time would you put down on your trip sheet for the entire day's work?

Answer..............hours..........minutes.

3. If you started to work at 6:27 a.m., and were relieved at 9:19 a.m., and resumed duty again at 10:47 a.m., and were relieved at 12:07 p.m., and started the last portion of your run at 3:57 p.m., and completed same at 7:11 p.m., how much time would you put down on your trip sheet for the entire day's work?

Answer............hours............minutes.

4. Add the following two problems:

9839	796
784	3957
977	486
7459	9758
585	945

5. Subtract the following four problems:

79381	93775	71005	50738
68493	92887	70996	49849

6. Multiply the following five problems:

9397	8995	4807	69387	7698
5	7	9	5	9

7. Divide the following four problems:

5)19790 5)9330 5)87505 5)3795

Date............19.... Signed.................................
Applicant.

Typical examination form used

In addition to the regular bonus, special awards have been given each year for particularly good service. During the year 1927 two classes of awards will be made. The first class gives an additional award of $40 to all men in active passenger service who have not lost more than 60 days time during the year, who have clear courtesy accident records and who have received no demerits. The second award gives an additional award of $20 to all men who have not lost more than 60 days time, who have clear courtesy and accident records, who have not been demerited more than three times and with no repetition under any one classification, and who have received no demerits for infraction of rules under the classifications printed in large type in the accompanying list. With these awards and the regular bonus, the company expects to spend during the next fiscal year of the bonus approximately $125,000 on the system. The bonus is credited monthly to the record and paid on the Dec. 15 for the previous fiscal year ending Dec. 1. If a man loses his job or leaves the company he automatically loses his bonus. Also a man does not participate in the bonus until he has been in the service of the company six months, a three months probation period being counted in this six months.

Notification is sent to each trainman on these forms as to demerits or credits or the cancellation of demerits

In 1921, out of 2,150 trainmen, 1,977 received the full bonus or a portion of it and 77 of these received extra awards. These extra awards consisted of a double bonus for the motorman and conductor of each of the five divisions whose standings were the highest, with additional special prizes of $25 for each of the second men, fifteen for the third and four additional prizes of ten dollars each as separate prizes for one-man car operators.

In 1922, out of the 2,350 trainmen, 1,930 received a full or portion of the bonus and 110 of the high men at the various divisions received special prizes aggregating about $4,000. The highest conductor and motorman in each division received $60, the next $25, the third $15 and four other prizes of $10 each.

In 1923 approximately $100,000 in bonus money was distributed to approximately 2,500 trainmen out of the 2,700 trainmen in the service. Special prizes were awarded to 110 of the top men. In 1924 2,330 trainmen participated in the bonus and received $106,000. New high records were established as regards the number of men participating and in the amounts paid. In 1925 2,208 trainmen participated in the bonus and received $110,000.

In 1926 the plan of awards was slightly changed to avoid a condition which experience showed to exist. Under the original merit system the $5 monthly bonus was paid to each trainman unless he was demerited or penalized for lost time, so that if his efficiency rating was 100 per cent or over and if he was not penalized for lost time he would receive the full bonus of $5 a month. Under this plan a man whose rating was 120 per cent might receive 50 demerits, which would lower his efficiency rating to 110 per cent, without affecting his bonus, as the bonus was affected only when his efficiency rating dropped below 100 per cent. In the plan now in force, when a man receives demerits, regardless of his efficiency rating, he loses 25 cents for each per cent deducted at the time demerits are assessed.

In 1926, in addition to the regular $60 a year bonus, special awards ranging from $10 to $100 were made to the ten top motormen, to the ten top conductors of each of the five divisions and to the ten top safety car operators. These prizes are divided as follows: There is one of $100, one of $75, one of $60, one of $40, one of $25, one of $15 and four of $10 each. These special awards went to 110 men. The absence of demerits and the amount of time worked were factors considered in picking these men. Mere accumulation of credits did not come in for any great amount of consideration as each man automatically received ten credits each month for a clear safety record, as well as ten credits for a clear courtesy record. This same method of picking men for special award is in effect for the fiscal year of 1927, but under an arrangement by which the highest man will receive only $40 instead of $100. However, there is a greater spread of special award money for the ensuing year and more awards will be made.

HOW DEMERITS OR CREDITS ARE GIVEN

In checking trainmen, supervisors and inspectors exhaust every possible effort to correct deficiency before recommending demerits. If they find they cannot handle the case without recommending demerits they report the fact to the supervisor of the merit system, who determines the number of demerits to be assessed for such violation and has the necessary entry made on the man's record. In most cases a man receives ten demerits for the first offense, ten for the second, fifteen for the third, twenty for the fourth, etc. When a man's rating drops to 90 per cent a personal letter is sent to him or he is asked to call at the office so that the supervisor of the merit system may go over his record with him. He is given to understand that he must discontinue violating the company rules if he expects to remain in the service.

Reports of trainmen's operating efficiency are made directly to the supervisor of the merit system. They come in on various forms, depending upon their origin. However, the responsibility for making the award of merits or demerits rests on the supervisor of the merit system. When his decision is reached, a notification slip is sent to the trainman, a blue slip advising him of demerits and a pink slip of credits. At this time the entry is made on the man's efficiency record card and his percentage worked out to include the particular demerit or credit.

On the efficiency record the credits are entered in black figures, the demerits in red and the percentage column in black, 100 per cent or over, and below this in red. This enables the supervisor to glance at a man's record card and tell at once whether he has been repeatedly demerited.

The merit system has succeeded far beyond the early anticipations of the company and after six years neither the higher officials nor the supervisors could be prevailed upon to abandon it, nor would the trainmen themselves give their consent if they had their choice. During the fiscal year 1924-25 the company adopted the policy of automatic cancellation. Under this plan, after the man had been demerited for violation of some rule, if he did not repeat the violation for a period of 90 days the demerits would automatically cancel themselves. After working this plan for a short time, it was found unsatisfactory. The merit system was originated and placed in operation by George Baker Anderson, manager of transportation, and is now under the direct supervision of R. A. Pierson, who reports to R. B. Hill, superintendent of operation.

Questionnaire

Motormen

Motormen will fill in answers to the questions given below on the reverse of this sheet, using additional paper if necessary, and numbering same to correspond to the question, and will turn the completed sheet in, signed with name, cap number and division, to the division foreman not later than April 24.

Motormen failing to give correct answers will be called in for additional instruction.

No. 1. What is required of a motorman when using group movement from the third position?

No. 2. What is required of a motorman when railroad crossings are being flagged?

No. 3. What is the rule in regard to backing up, and how can you signal your conductor when wishing to back up a short distance?

No. 4. What does a plain yellow sign, or one with a black cross on same, indicate when suspended from span wire?

No. 5. When power is off, are cars to be allowed to coast down grade, and if not, why? And what cars start first after the power has been off?

No. 6. Under what conditions may passengers be passed up, and what precautions must be taken when doing so?

No. 7. Are cars allowed to group over electric switches, or double in opposite directions over same?

No. 8. What is the road space rule when operating in Zone No. 2, and why should a motorman so operate his car as to avoid having to make the 100-ft. stop?

No. 9. Mention five things which a motorman must not do while the car is in motion.

No. 10. At what speed should a car be operated, and what precaution should be taken when unloading newspapers?

No. 11. Is it permissible to pull a car in over the pits while passengers are still on board?

No. 12. Who is responsible for knowing that all necessary dash signs are on the car before pulling out?

R. B. HILL,
Superintendent of Operation.

Carpenter Shop Waste Disposal Plant

Shavings and Sawdust Are Conducted Directly to an Incinerator, Where They Are Disposed of Speedily and with No Excess Labor

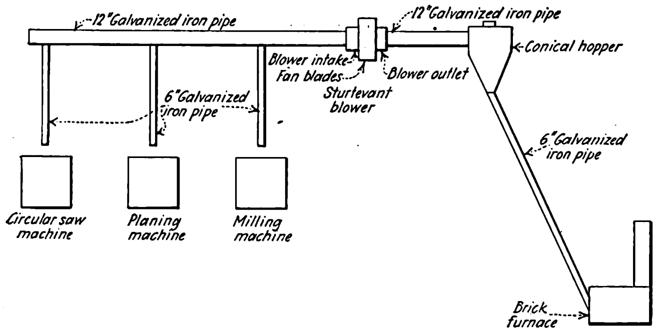
EQUIPMENT for the automatic removal of sawdust and shavings from the various wood-working machines to an incinerator is a feature of the carpenter shop of the Virginia Electric & Power Company, Richmond, Va.

A 36-in. Sturtevant blower erected on a solid foundation about 15 ft. above the carpenter shop floor is driven by a belt from a near-by line shaft. A 12-in. galvanized pipe connected to the intake of this blower extends longitudinally through the shop. A 6-in. galvanized pipe leads to the 12-in. pipe directly from each sawdust or shaving forming machine from which the refuse is to be collected. One end of the 12-in. galvanized pipe is connected to the outlet side of the blower and the other end is fastened to the top of a conical hopper erected in the yard directly back of the shop.

A 6-in. galvanized pipe connected to the bottom of this hopper extends downward at an angle of about 45 deg. and enters the firebox of a brick furnace erected about 15 ft. distant.

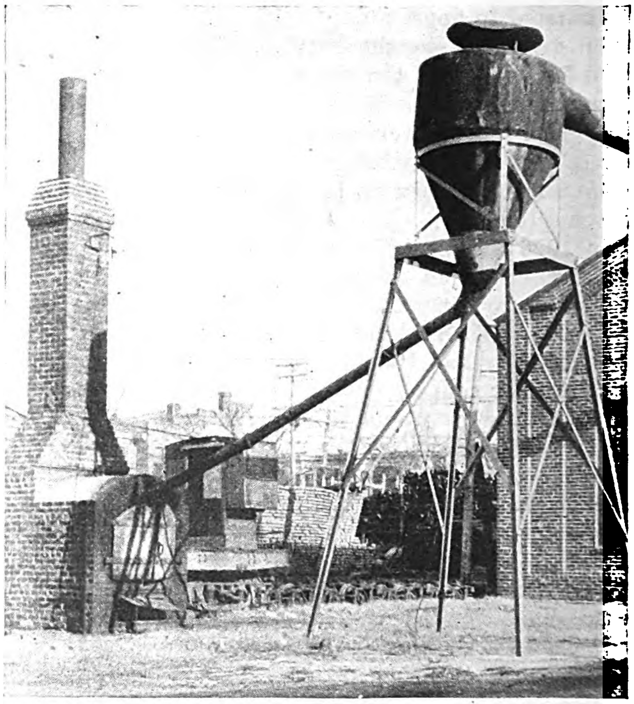
Immediately after its formation waste material is drawn up through the 6-in. pipe by the fan intake into the 12-in. pipe connected to the intake side of the blower. From here it continues on, passes through the blower fan blades, is blown through the 12-in. pipe connected with the outlet side of the fan and is deposited into the hopper in the yard. The waste swirls around inside of the hopper, drops to its bottom and passes out through the 6-in. pipe, finally falling into the firebox, where it is burned.

The pipes and hopper are made of No. 16 galvanized iron. Careful riveting and soldering of all joints provides an airtight line. The blower air is exhausted through a fine-mesh screened opening in the top of the hopper, which has an over-all depth of 9 ft. and a maximum diameter of 6 ft. The depth of the cylindrical portion above the supporting frame belt is 3 ft.



General arrangement of equipment for disposal of wood waste in Richmond, Va.

The furnace is built of ordinary red brick. Its outside base is 6 ft. x 6 ft. and the firebox is 5 ft. x 4 ft. x 4 ft. Above the firebox the base tapers down to 30 in. x 30 in. for the formation of the chimney. A damper in the chimney permits of draft regulation. The firebox is provided with an iron grate. Both the firebox and ash compartment are inclosed by heavy iron doors.



Tower, conical hopper, brick furnace and waste pipes used for wood refuse disposal in the Richmond, Va., shop of the Virginia Electric & Power Company

The tower uprights for the support of the conical hopper consist of 50-lb. T-rail imbedded in a concrete foundation. These four T-rails are bound together at the top by a 6-in. angle frame. The reinforcement is made of 2-in. angles. The supporting cradle for the conical reservoir is made of $\frac{1}{2}$-in. x 3-in. bar iron. All of the framing is carefully designed and riveted securely together.

This incinerator not only disposes of the carpenter shop refuse material, but of practically all inflammable waste collected throughout the shop and grounds. It has provided a means for maintaining a neat and clean carpenter shop appearance and has eliminated the necessity of constantly removing the rapidly accumulating waste by hand, thereby effecting a substantial saving in labor. The danger of fire has been reduced by the immediate disposal and burning up of the waste material.

Alarm Clocks for Bus Patrons

BUS patrons of the San Antonio Public Service Company, San Antonio, Tex., are pleased with an ingenious device installed at one of the company's loading stations for showing the time their next bus will arrive. An alarm clock with illuminated dial has been placed in the center of a square piece of cardboard on which are printed the names of the different lines, showing the time the next bus will arrive. For example, if a bus leaves the station every twenty minutes starting on the hour, then the name of that bus line is printed above the figure "12" on the clock, next to the figure "4" and the figure "8." Similar names printed around the face of the clock show the time each bus leaves, and a glance at the clock shows the patron how long it will be before another bus on that line is due. This practice has proved very popular with the patrons. Women who have one or two purchases to make are able to see by the clock that they still have a few minutes and are thus assured of making their purchases without missing their bus. The arrangement is simple and inexpensive, yet it is a point of service which cannot be readily overlooked.

The Readers' Forum

The Glory that Is Rome's

NEW YORK, June 2, 1927.

To the Editor:

Methods of transportation used in the Eternal City were brought home forcefully to me by the article in the JOURNAL for May 28. Many of the practices reviewed therein contain nothing new to the sophisticated European traveler, but not many men in America are foreign travelers or sophisticated when it comes to things European. For that very reason the account should be of the greatest interest to American readers. Not only that, but throughout the story there was just the touch of local atmosphere imbibed by the observer on the spot that was needed to convey the reasons for some of the differences between American and European practices.

Of course the main transportation problem, that of getting vehicles through the central district quickly, is the same here as it is abroad, but the difference in habits of the continental injects the elements that make for dissimilarity of detail. Consider the matter of peak loads! The taking of two hours for lunch is not unusual among American business men, but it does not extend to the rank and file here. Moreover, the noonday recess in American cities is not attendant with the formality that attaches to the process in Europe. Appreciation of the pomp and circumstance which attend this European noonday shutdown are essential to the American if he is to understand fully the differences in the peaks of riding which this leisurely practice introduces as a problem to the European operating executive. But this is only one of many things. The reference to the rarity of the traffic policeman in Rome is also another touch of local color, just as is the observation that motor traffic in Rome shuns the streets on which there are car tracks. It is interesting to reiterate that the present independent bus service is routed over streets that do not contemplate the ascension of any of the seven hills on which the city is built. That work is left for the trolley.

It is nothing new, of course, to know that the selling of the tramway service has long been a factor in the scheme of things of the tramway management at Rome, but the extent to which the process has been carried must have come as a revelation to many American readers. Particularly wise have the Latins been in so arranging the "tramway guide" that it is sold, rather than given away, for it is a notorious fact that human nature takes lightly the things that are free. Technically, of course, the American trainman may have the right to refuse admittance to the passenger who does not proffer the exact fare, but it must seem a little strange to the American operator to observe that it has been made plain to the riders of Rome that the trainman "has the right to refuse admittance to the car to all persons who do not present the exact fee."

The account of railway operation in Rome as set down in the JOURNAL was most interesting. It all goes to show, as the writer in the JOURNAL intimated, that transportation men the world over are kin and that dependable transportation is essential much of the time to the colonel and his lady and all of the time to Mr. and Mrs. O'Grady.

J. G. RAYMUR.

Performance Figures on Great Northern Oil-Electric Locomotive

PERSONS interested in the performance of oil-electric units will welcome the following figures compiled by the Great Northern Railway on its oil-electric locomotive No. 5100, now in switching service at Minneapolis. The compilations, furnished through the courtesy of W. R. Mills, general advertising agent at St. Paul, Minn., cover April, 1927. The engine was in service 575 hours at 6 m.p.h. and traveled 3,450 miles.

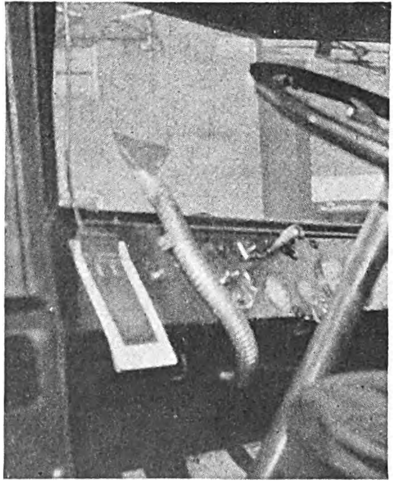
REPAIRS		
Labor		$177.64
Material		71.95
Total cost of repairs		$249.59
Cost of fuel oil—5,740 gal. at 3 cents per gallon		172.20
Cost of lubricating oil		53.79
Cost of miscellaneous supplies		3.26
Engine house expense, thirteen handlings at $4.184		54.40
Enginemen's wages:		
Engineers	$541.95	
Firemen	409.65	
Total		951.60
Total		$1,484.84

COSTS IN CENTS PER MILE TO RUN OIL-ELECTRIC ENGINE:	
Repairs	7.23
Fuel	5.00
Engine house expenses	1.58
Lubridants	1.56
Other supplies	.09
Wages	27.58
Total	43.04

The following comparison may also be interesting:

	Oil-Electric Engine	Eight-Wheel Switch Engine
Tractive power	60,000	58,500
Weight on drivers	209,500	232,600
Total weight engine and tender	209,500	375,500
Weight on drivers to T. P.	3.47	3.98
Superheated		Yes

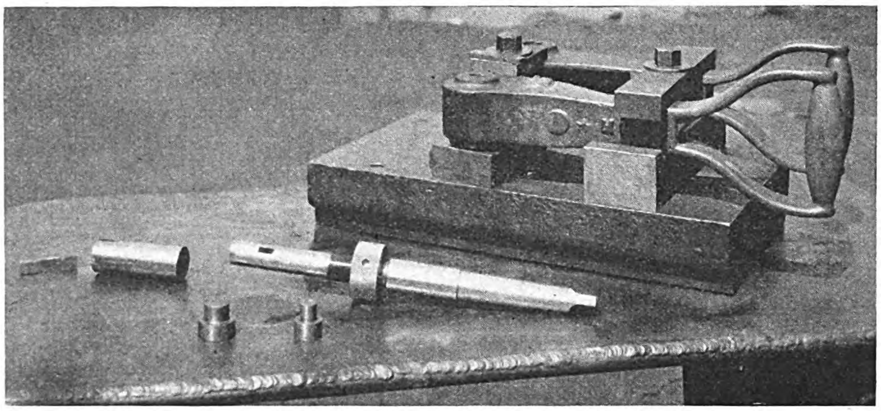
Windshields Kept Free of Frost



Hot air dries windshield

WINDSHIELDS of the interurban buses operated by the Indiana-Columbus Eastern Traction Company are kept free of frost by a small stream of hot air from the engine. The illustration shows a flexible metallic tube carried out over the exhaust manifold, through which the heated air is conducted to a flat-edged nozzle, so that it blows on the inside of the windshield, keeping it just warm enough to prevent the formation of frost or mist in any weather. This simple device, made in the shops of the company, has been used on practically all of the buses throughout the past winter. These buses operate between Dayton, Springfield and Columbus, a distance of 52 miles, at 30 to 35 m.p.h.

screws. The bottom end has two rectangular openings for inserting cutting tools. The second part of the tool consists of a sleeve which fits over the bottom portion of the shank. This has notches at one end so that when the cutting bit, which is the third part of the device, is inserted through one of the rectangular holes in the shank, the sleeve can be forced down against the bit by turning the knurled collar, and the notched portion fits over the cutting tool to hold it securely.



Fixture for finishing brake handles and plug gages for testing

For the finishing work, two handles are placed in a special jig. When the handles are rights and lefts one of each kind is used. When the handles are of the same type one is turned with the reverse side up. The holes cored through the center in the rough casting are first bored out to the required size. They are of two diameters, the top 1⅛ in. and the bottom 13/16 in. After the holes are bored out the facing tool is inserted and the top portion is finished. The cutting bit is then removed by loosening the knurled collar and the shank is lowered so as to project through the top surface. The tool is then inserted inside the casting and the underside of the top boss, together with the top side of the lower boss, is finished. The final operation consists of finishing off the face at the bottom. For this the handle is reversed.

In the accompanying illustration the cutting bit is shown at the extreme left, the sleeve which fits over the shank in the center and the shank itself with the knurled clamping collar to the right. The jig with

$200
for 100 Words

First	$200
Second	$100
Third	$ 50
Monthly Prize	$ 25

AWARD of the first monthly prize in ELECTRIC RAILWAY JOURNAL'S Maintenance Competition, announced in last week's issue, has stimulated efforts to be the winner of one of the capital prizes as well as a monthly prize. Who will be the winner of the next monthly prize? One thing that has received comment is that but a very short description of an idea can win the prize. This is one time that the number of words does not count. It is the value of the idea that receives first consideration.

The real stimulus in all sports is that there is a chance to win. We play harder, work harder and think harder when there is sure to be some recognition that the best effort will be acknowledged. The prizes in ELECTRIC RAILWAY JOURNAL'S Maintenance Competition are offered as a stimulus to maintenance men in any electric railway department to develop and adopt improved methods for performing a routine job. The prizes will be awarded primarily on the value of the idea presented and its adaptability to maintenance work. Still greater value than that afforded by the cash prizes may result from the recognition that the winners can be considered as leaders in improved maintenance.

GENERAL PROVISIONS

ANY employee of an operating electric railway or electric railway bus subsidiary may compete for the prizes to be given by ELECTRIC RAILWAY JOURNAL for short maintenance items. Full information is given in the April 16, 1927, issue, pages 700-701.

The author does not necessarily have to be the originator of the idea or device. An article may be submitted by several persons or by a department and need not be written by the person in whose name it is submitted.

Articles may treat of any maintenance practice or device used by any department of an electric railway and should be preferably 100 to 200 words in length and accompanied by one illustration. Brevity consistent with a proper presentation of information will be given weight in judging articles. In no event should they be longer than 400 words with more than two illustrations.

Manuscripts should be mailed to the editor of ELECTRIC RAILWAY JOURNAL, Tenth Avenue at 36th Street, New York, N. Y. To be eligible for the capital prizes, the envelope must bear a postmark dated before Aug. 1, 1927.

In addition, a prize of $25 will be awarded each month. Groups of articles submitted were published in the Maintenance Data Section of ELECTRIC RAILWAY JOURNAL for May 21 and June 18, 1927.

If sketches accompany the manuscripts they may be in pencil, or blueprints will be accepted. Each item submitted should bear the name or names of the individual or individuals by whom it is submitted and to whom awards are to be made. The manuscript should also be marked "Maintenance Competition."

The announcement of the winner of each monthly contest will be made in the issue devoted to maintenance and construction, the third issue of the month, following the one containing the item.

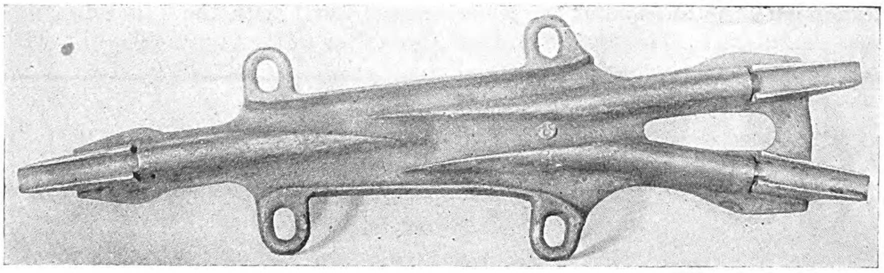
The winners of the capital prizes will be announced in the Annual Convention Number of ELECTRIC RAILWAY JOURNAL, to be published in September, 1927.

two handles in position, is shown in the background. The two small parts in the foreground are plug gages for checking the size of holes bored in the handle.

New Equipment Available

Overlapping Runner Trolley Frog

CUTTING of the pan by the trolley wheel is said to be eliminated by the type CF overlapping runner trolley frog developed by the Westinghouse Electric & Manufacturing Company. The open space in the pan has been removed by overlapping the runners so that at all times the wheel rides on the runners and the flanges do not touch the pan. This results in from three to four times the length of life of the open pan frog. This type of frog insures more positive tracking of the wheel. It is equipped with bayonet type approaches, which are easy to install and which give a smooth transition of the wheel from the wire to the runner of the frog. The frog is made in 15-deg. right-hand and left-hand V shape and 20-deg. right hand and left hand. It is made for all sizes and shapes of wire.



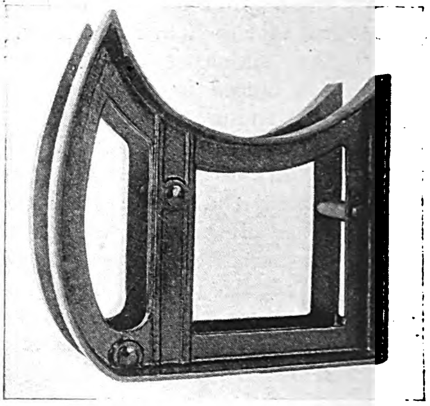
With this frog the trolley wheel flanges do not touch the pan

Cradle Assists in Framing Poles

DURING the past years of pole line construction crews have followed the practice of lifting the pole up bodily while a support was placed under it. To reduce the number of accidents which occur from this method and also to provide an easier means of framing poles the E-Z-Up pole cradle has been developed and is now being marketed by Farnham & Cunningham, Los Angeles, Cal.

This new pole cradle uses the cam principle to lift a pole into position for framing. It is made of malleable steel and a cant hook or peavey is the only additional tool equipment necessary besides the cradle. In using, the E-Z-Up pole cradle is placed against the pole and the point of the cant hook or peavey is dropped between the two rockers so that the end presses against the cross bar nearest the nose of the cradle. The hook then catches in the opposite side of the pole and by pulling the handle and pressing with the foot against the heel of the cradle the pole is rocked into position. In case the pole does not lie with the proper face up it can be rotated easily in the saddle of the cradle by the use of the cant hook.

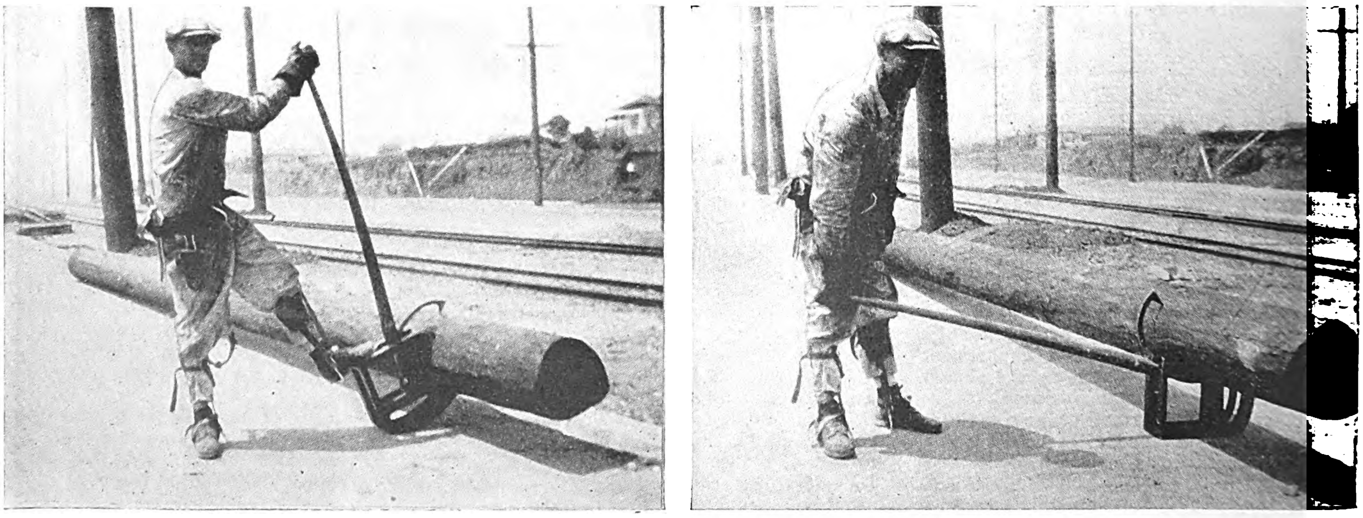
Cradle and cant hook in position to lift pole



The E-Z-Up pole cradle

If it is desired to raise the end of the pole to a higher position, the cradle should be placed further down on the pole. It can be placed at the approximate center of gravity of the pole and one man can turn the pole easily end for end by adding his weight to the high end of the pole. Where work is to be done on soft or sandy soil a board or thin steel plate should be placed under the cradle to keep it from sinking into the ground.

A lineman of average weight has no difficulty in lifting a 65-ft. cedar pole with this device.



At left, with the workman's foot pressed against the cradle, the handle of the cant hook is drawn toward him. At right, final position of the pole as it rests on the cradle

Field of the Motor Bus*

By A. J. Brosseau

President Mack Trucks, Inc.

If we glance at the statistics of bus use we will find that of the 80,000 vehicles now in service, 32,778 are employed in transporting children back and forth from school. This business is nearly all in the hands of the so-called independent operators. For future bus use here is one of the largest fields.

As to the rail carriers, there are indications on every side that they should extend the use of the bus in urban operations. Two of the most promising fields are:

The marginal area in every city, in which rail car services are performed at a loss.

The de luxe express service from these districts to downtown areas, or both of these services.

In these fields the wideawake and forward-looking rail carrier can employ the bus to his advantage and render his customers better service, at lower cost, than he can by using the trolley.

The place of rail lines in handling mass transportation in congested centers appears, at the moment, to be secure from an economic point of view. At what point of thinning density, however, the bus begins to give a superior all-round service upon an economical and profitable basis is a question upon which there is not yet conclusive evidence. We know that the vehicle has been substituted for entire trolley systems in 65 towns and cities, all of them under 100,000 population. Whether the bus, in its present state of development, can replace the trolley in cities of larger size must be decided by the experience of the rail operators with buses.

This experience, to be worth while, must be based on facts—all the facts. "Experience" to prove that buses are not as efficient or desirable as the trolleys can easily be upheld by any one who is determined to prove the superiority of the trolley by overlooking some of the facts. On the other hand, the case of the bus must be proved by facts—all the facts. The time has come when both trolley and bus must stand or fall on their respective merits.

Eventually, all street railway companies come to the point where new equipment has to be purchased, new rails or pavement or both installed, and power houses renovated. When this happens they must decide whether it is advisable to substitute buses for rail operations.

When the bus first made its appearance in the rural field there was a common impression among rail operators that it was destined to make serious inroads upon their passenger business. Events of the past year and particularly the investigation of the Interstate Commerce Commission have done much to clarify this situation and bring out the facts. We have only to read the testimony of such high railroad officials as P. S. Eustice of the Burlington, F. A. Wadleigh of the Denver & Rio Grande, F. A. Coley of the New York, New Haven & Hartford, and Lewis Saunders of the Gainesville & Northwestern, to appreciate that it was the private automobile—not the bus—which was responsible for nearly all railroad passenger business losses.

The experience of the 61 railroads now operating motor buses would tell a story of savings effected by the substitution of the bus for the unprofitable branch-line rail operation, and that the rail lines are beginning to realize the benefits of improved public relations, growing out of a more frequent and more comfortable service to the public.

I believe that as railroad men give more and more time to the study of savings in costs to be effected by motor transportation, they will turn increasingly to the use of the bus for local operations. In many instances this would mean competition with, or acquisition of, or contract relations with existing independent bus lines. But whatever the method, there will be an expansion of bus services by rail operators, who will then, without extra cost to them, be enabled to give the public more frequent and satisfactory service.

Regardless of the extent to which steam or trolley rail lines go into the bus business, there will remain for the independent bus operator a large field in which he can develop a much needed service to the public. It must be remembered that the greater percentage of the bus movement is not competitive. Assistant Secretary of Commerce J. Walter Drake has pointed out that the bus has placed in touch with the railroads some 45,000 communities not located on rail lines. I believe these independent bus operations will be in the hands of responsible owners operating large or small fleets as local conditions justify.

Liberal Regulation Needed

The troublesome question of regulation is as yet unsolved. I am not an authority on the subject, but permit me to point out some elements which I consider fundamental.

One of the chief virtues of the bus is its mobility. It does not run on rails, but it can go wherever there is an improved road.

It is not costly to stop, hence it can pick up passengers at any point.

Rates per mile should not be uniform unless road and other conditions are comparable.

Regulation should not be based on rail or bus practice of today.

Elaborate systems, such as apply to rail lines, are not needed.

Disregard all or part of these factors and you will retard bus development and so hamper it as to deny the public the benefit of its use.

I emphasize these points because in the initial stages of bus regulation precisely these things were attempted. Legislators, in many cases, did not take into consideration that the bus performs an entirely different service from that of the rail line and that it should be regulated as a bus—not as a rail vehicle.

Bus regulation, of the railroad type, is not only restricted, but it is contrary to the public interest. There are those who believe this sort of punitive regulation was, in the past, prompted by hostile rail interests. Regardless of where the responsibility lies, I am sure rail lines, now operating buses, will not approve of it.

COMING MEETINGS OF *Electric Railway and Allied Associations*

June 27, 28—**Public Utilities Advertising Association, Hotel Albany, Denver, Col.**

June 29-July 1—**Central Electric Railway Association, summer meeting, Book-Cadillac Hotel, Detroit, Mich.**

June 30-July 1—**Tramways and Light Railways Association, annual meeting, Bath, England.**

July 11-14—**American Society Civil Engineers, convention, Denver, Col.**

July 22, 23—**Central Electric Railway Accountants' Association, Tuller Hotel, Detroit, Mich.**

July 27-29—**Association of Equipment Men, Southern Properties, 12th semi-annual meeting, Atlanta, Ga.**

Sept. 8—**Central Electric Railway Master Mechanics Association, South Bend, Ind.**

Sept. 13-15—**International City Managers Association, Dubuque, Ia.**

Oct. 3-7—**American Electric Railway Association, annual convention, and exhibit, Public Auditorium, Cleveland, Ohio. Exhibits open at noon of Oct. 1.**

*Abstract of address delivered before Bus Division, American Automobile Association, Philadelphia, June 15, 1927.

Bus development can only come as we have regulation based upon the following principles:

Varying standards of rates.

Liberal policies with respect to development of new lines.

Sympathetic co-operation on the part of regulating bodies with respect to flexible schedules, so adjusted as to give necessary service with a minimum of waste.

Protection of existing lines of one type against interlopers of the same type, so long as public service requirements are met.

In short, regulation which considers first the needs and desires of the public, and second, the interests of the carriers.

I do not say there should be no regulation. But I do believe that such regulation as may be adopted should be based upon the differences, as well as the similarities, which exist between rail and highway operation.

The bus industry is young. It is virile and growing. It will grow faster and on a more substantial basis if those interested in its development keep constantly in mind that the public interest should have first consideration. And in this connection one should not overlook the interests of the public in existing rail carriers.

I am not one of those who believe that if a rail carrier has adequate physical facilities to carry passengers over a given route the public should be denied the use of the bus if it wants and is willing to pay for that form of transportation. In such instances regulating bodies should determine to what extent the rail carriers may add or substitute bus for rail service, or grant franchises to an independent operator. The carrier—whether rail or highway—should be protected against destructive and uneconomic competition so long as it properly serves the public.

With respect to taxation—the bus, like any other highway unit, should pay a fair charge for its use of the public highway. It is doing so today, as government figures prove.

Unfair and punitive taxation levied against the bus will be reflected in increased cost to the consumer of highway transportation.

Remember that the bus is in its infancy; it has been in existence only a few years; it has a field all its own; it renders a character of service different from, and not furnished by, rail carriers.

If these principles are kept constantly in mind, the independent operator and the rail carriers will find a broad basis of co-operation to the mutual advantage of both.

International Association Holds Convention This Week

THE fourth annual convention of the Internationaler Strassenbahn und Kleinbahnverein was held this week in Copenhagen, Denmark. The members of this association are electric railway and bus lines in Central Europe, and its headquarters are in Vienna. Sessions were held each morning this week from Monday to Wednesday inclusive, and Thursday was devoted to a trip to neighboring points of interest. A list of the technical papers presented follows:

"The Effect of the Sorbitic Treatment on Rail Life."

"Problems of City Operation in Sweden."

"Disturbances to Radio Broadcasting."

"Bases for Operating Statistics."

"Car Cards and Other Advertising on Street and Interurban Railways."

"Economies in Local Railway Operation."

"Methods of Trans-shipment of Freight Between Main Line Railroads and Motor Trucks."

"Co-ordination Between Main Line Railroads and Motor Trucks from the Standpoint of the Public."

"Co-ordination Between the Motor Bus and Street Railways in Large Communities."

"Co-ordination Between Bus and Truck Operation and Interurban Railways."

"Recent Improvements in Carhouse and Repair Shop Practice of the Copenhagen Street Railway, with Special Reference to Brake Inspection and Painting."

"Improvements in Car Speeds in City and Interurban Service."

It is understood that at the Copenhagen meeting consideration was to be given to the question of the consolidation of the association with the street and interurban railway and bus association of western Europe.

American Association News

Power Transmission and Distribution

FINAL reports of sub-committees and decisions to clean up this year's work formed a busy two-day session of the power transmission and distribution committee which was held at association headquarters, New York City, on June 16 and 17. Those present were F. McVittie, chairman; J. Walter Allen, W. H. Bassett, M. W. Cooke, J. H. Drew, J. C. Damon, C. L. Hancock, S. S. Hertz, K. J. Keith, A. J. Klatte, J. Leisenring, H. S. Murphy, J. F. Neild, W. J. Quinn, M. B. Rosevear, W. Schaake, A. Schlesinger, R. D. Wade, C. H. Jones, sponsor, and H. C. Casey representing G. F. Wennagel.

A number of new subjects of interest to power transmission and distribution engineers were suggested for consideration by ensuing committees. Sub-committee No. 1 on review of existing standards reported some desirable changes and recommended that the specifications of electric conduit construction be referred to next year's committee, also that lightning protection on car and line equipment be studied by a special committee.

Sub-committee No. 2 on specifications for catenary material presented a progress report that was adopted and will be reprinted in this year's proceedings. Changes were suggested as a basis for revising these specifications.

Sub-committee No. 3 on trolley wire wear reported that the work of the last two years will be brought up to date and that tabulations and graphs will be prepared for comparative purposes. Mr. Murphy, chairman of the committee, presented a design for a measuring device for trolley wire.

Sub-committee No. 4 on specifications for high strength trolley wire reported that a compromise with the A.S.T.M. committee on specifications for high strength trolley wire has been reached. If this recommendation passes both the A.E.R.A. and the A.S.T.M., a final specification will be in effect.

A report was presented by sub-committee No. 5 on radio interference to the effect that this sub-committee be combined with the inductive co-ordination sub-committee in order to furnish information that may be desired regarding reports of interference. Sub-committee No. 6 on inductive co-ordination reported that no definite developments have taken place during the year and so a progress report only can be made.

A recommendation from sub-committee No. 7 on feeder ties between automatic substations was presented to the effect that the subject should be discontinued.

Sub-committee No. 8 on comparison of operating methods and sub-committee No. 9 on trolley wire reels presented progress reports.

A.E.R.A. Reports in Preparation

SPECIAL reports are being prepared by the Bureau of Information and Service of the American Electric Railway Association, and will be available upon request by member companies, as follows:

Bulletin No. 144.—*Operating Costs of Electric Railway Motor Bus Lines,* 1926.—A summary of the operating costs of 140 electric railway bus undertakings in 1926 and a comparative study of the operating costs of 102 bus operations in 1926 and 1925. The operations have been classified as city, interurban, or combination city and interurban service. Details of average operating expenses are given for each group and the depreciation methods adopted are analyzed and presented in tabular form.

Bulletin No. 145.—*Comparison of Electric Railway Operating Conditions, Operating Expenses and Results of Operation on Various Unit Bases.*—This is a tabulation of comparative unit figures and ratios derived from the operating reports of electric railways in 1926. The cities are grouped according to their population and there is shown for each city the riding habit, average speed, number of revenue passengers, car-miles per mile of track and per car operated, revenue per mile of track, operating ratio, number of passengers per car-mile, proportion of passengers using transfers, cost of maintenance of plant and equipment per car-mile, per unit of property maintained and in per cent of total operating expenses. The operating expenses as distinct from maintenance expenses are also given on comparative unit bases and in per cent of total expenses.

Bulletin No. 146.—*Accident Prevention and Safety Work of Electric Railways.*—Gives a list of companies carrying on accident prevention or safety work and shows the type of accident prevention work done and what these companies think of its effectiveness. The types of safety work covered are bonus awards to trainmen, competing contests, safety campaigns, organization of safety committees, employment of safety engineers, etc.

The News of the Industry

Fare Increase Accepted in Buffalo

International Railway Makes Statement in Which It Enters Plea for Public Support

Formal acceptance has been noted by the International Railway of the order of the Public Service Commission increasing the rate of fare in the city of Buffalo from 8 cents, with two tokens for 15 cents, to 10 cents with three tickets for 25 cents. The company has assured the commission that it welcomes the opportunity to proceed with track and paving reconstruction. As the opinion of the commission points out, the extensive program set up by the city cannot be completed in one season, nor can the company undertake it without revenues. In the memorandum of acceptance to the commission President Yungbluth said:

While at this time the International Railway has no desire to make any further statements in regard to its expectations from the new fare, it feels that it can do no less than again call attention to its letter of June 8 to the commission. In view of the facts therein set forth, it is obvious that the International Railway can make no further promise than that which it now gladly makes, that although it believes the additional revenue in 1927 will be only $150,000, during this period it will spend $250,000 for track and paving reconstruction. Materials will be ordered at once. The earliest delivery procurable is about Aug. 15, at which time this work will commence. Track and paving reconstruction this year will be done on streets approved by the public authorities.

The opinion of the commission further points out that prolonged and bitter controversy and litigation between city and company advantage neither. In the hope of ushering in the dawn of a new era the International Railway is willing to co-operate with the city, by settling at once all litigation, so that this new fare may have a fair trial under the most auspicious circumstances. Furthermore, the company will gladly enter into conference with the city, as suggested by the commission. The railway also again restates its readiness to serve the public convenience by starting bus lines in accordance with the plan agreed upon by the city, the business organizations and the company, and repeatedly demanded by citizens in the districts to be served.

Since the International Railway will devote this year more money to the reconstruction of track and paving than it believes will be produced by the new fare, it is hoped that the public will support this program by increased riding.

The letter of June 8, to which reference was made, follows:

Newspapers have recently indicated that the Public Service Commission may authorize an increased fare of 10 cents cash, three tickets for 25 cents, coupled with the requirement that the company this year undertake a track reconstruction and paving program of more than $900,000.

Upon the granting of any additional fare, the people of Buffalo, assuming the proceeds to be sufficient to meet the necessities, would expect the company to commence a substantial reconstruction program. That is the outstanding thing in the public mind.

The following facts are again brought to the attention of the commission lest by any utterance or order it should create in the public mind hopes and expectations which are beyond the power of the company to fulfill.

The additional revenue from such a rate of fare is by International Railway traffic engineers optimistically estimated at $300,000 a year. This is based upon a loss in riding of 7½ per cent under 1926. As the company is already experiencing a loss of 6 per cent under last year, a fare of 10 cents cash, three tickets for 25 cents, will produce revenue equal only to that of 1926.

Nearly nine months ago the railway petitioned the Public Service Commission to grant in the city of Buffalo increased car rates—a straight 10-cent fare. The outstanding circumstances demonstrating the necessity were stated. Briefly they are:

The International Railway has shown a loss each year from 1918 to 1925.

The International Railway stockholders have received no dividend since 1918, but have contributed $4,140,445 to the company.

There is an increasingly insistent demand for street repaving and track reconstruction. The cost to the company in Buffalo alone for such work, now pressing, exceeds $2,000,000. Additional reconstruction will be required from year to year, in the future.

The company desires to do this work, but can do it only as fast as the commission makes available the additional revenue necessarily required.

Master Celebration Staged by New C., H. & D. Railway

Old Equipment Burned Before Public Assemblage as Final Act in Program of Complete Rehabilitation of Ohio Interurban—Celebration Preceded by Dinner in Company's Shops

From 10,000 to 20,000 people gathered on the evening of June 22 in a natural amphitheater just north of the new Moraine shops of the Cincinnati, Hamilton & Dayton Railway and cheered as the flames fed by the 30-year-old electric railway cars lighted up the countryside.

The event was staged by the railway in celebration of the completion of a rehabilitation program costing nearly $2,000,000. This included the acquisition of a new steel and concrete shop building at Moraine, extensive additions to freight terminal facilities, purchase of an entirely new complement of 40 C.E.R.A. standard box cars with necessary locomotives, overhauling of the power transmission and distribution system, including the construction of eight full automatic substations, and practically complete substitution of new de luxe cars for all of the company's former interurban and city equipment.

New de luxe city cars built for the road by the Cincinnati Car Company for service at the Dayton end of the line have been in operation for six weeks and have already shown an increase in passenger revenue of 13 per cent over the six weeks prior to their installation, or 20 per cent increase in comparison with the corresponding period of last year. Delivery of ten new interurban cars by the G. C. Kuhlman Car Company marked the arrival of the last of the new equipment for the property and was the occasion for the community celebration to mark the beginning of a new era on this road through the Miami Valley, which has had a career of financial difficulties, lapsed leases, foreclosures, receiverships and legal battles.

One Car for Each Community

An old, decrepit car for each important town along the line was drawn up in the center of the field where the celebration was staged. The mayors of each of these cities touched in rapid succession the seven buttons which set the spark to the fire that spelled the end of run-down equipment and old-fashioned methods. Through an elaborate outdoor amplifier system Dr. Thomas Conway, Jr., president of the railway, whose imagination, faith and courage were responsible for the rebirth of the interurban railway, explained to the thousands within hearing of his electrically magnified voice the significance of each step in the program and the plans and hopes of the railway for the future.

Great Public Interest

Under cover of protecting darkness, all of the company's new interurban equipment had been lined up on the railway embankment above the heads of the gathering. As the flames from the rapidly consumed cars in the fire began to subside floodlights properly located in the field and suddenly switched on threw their rays full on the new cars, which shone in the darkness before the eyes of the large crowd.

Sirens and bells on the cars were sounded as a fireworks display burst in brilliant rockets and bombs far up over the heads of the crowd and a set piece announced in glaring letters the birth of "A New C., H. & D. Railway."

For nearly half an hour the display continued while the old cars burned themselves, until only the frames stood revealed like a skeleton. Train crews on the new cars above, in carefully groomed and pressed uniforms, clanged their gongs and yanked at the control cords of the sirens.

So great was the throng thus attracted to celebrate the rebirth of an interurban railway that every approach to the site of the spectacle was jammed with automobiles for hours preceding and following the event. The elaborate parking facilities provided were taxed to capacity. In addition, roadsides and vacant bits of property in every direction were jammed with cars while their owners sought a view of the strange spectacle presented by the burning of cars which they had seen daily since childhood and had come to look upon as inseparably associated with the idea of an electric railway ride.

PRECEDED BY DINNER

The public celebration was preceded by a dinner in the company's new shop and office building to more than 400 guests, comprising the prominent public officials and leading business men of the Miami Valley, security holders and officials of the railway and visiting executives from many other railway properties. These men came from various cities along the line in special cars and were permitted to inspect the property before attending the celebration. During the dinner President Conway reviewed the history of the property and described the extent of the rehabilitation program. He summarized the aims of the new management and made a strong plea for the active public co-operation and support so necessary to the success of the ambitious project which had been undertaken.

As the various special trains decorated with banners announcing the celebration proceeded through the communities along the line the population turned out in force.

Chicago Enabling Legislation Encounters Opposition

Chicago's five traction bills, after passing the state Senate with votes to spare, have encountered some little opposition in the committee of the House of Representatives, to which they passed from the Senate. Politics, both state and municipal, and newspaper criticism have been unusually heated in the controversy which has developed.

A number of amendments have been submitted to the committee which is considering the bills and a special meeting of the Chicago City Council resulted in an almost unanimous approval of these proposed changes. The representatives of the companies have not signified their approval of the amendments, at the present time, and it is considered doubtful that they will accept them. Among the changes proposed are:

Change in the indeterminate franchise bill to limit a franchise to a 40-year period and only in excess of twenty years upon a referendum vote.

Changing the bill giving the elevated lines power to merge the various transportation companies in Chicago so that any of the companies might carry out the consolidation.

Amendment of the bill creating a commission with authority over the transportation companies composed of state, county and city appointees so that a majority of the members of the commission will be city appointees.

Explicit definition of the terms "non-user" and "mis-user" used in one of the bills.

The Chicago Aldermen were loud in their demands at the meeting for home rule to its fullest extent. One of the City Council declarations on the amendments, showing clearly their stand on the bills, read as follows:

> We declare that if the bills are not amended, or if they are left in the unfair condition in which they passed the Senate, then the resulting legislation will not be enabling, but will be so obstructive that this body will be unable to make use of the legislation in attempting to solve the railway problem.

A committee of Aldermen was dispatched to the state capital to present these demands before the transportation committee of the House.

A statement setting forth the concise stand of Samuel Insull, head of the elevated lines, in the question was issued by him to the newspapers.

New York City Would Recapture Rapid Transit Lines

Columns of space have been devoted by the New York newspapers to the discussion of the tentative unification plan for New York City rapid transit lines proposed by the Transit Commission and the Board of Transportation. Reduced to their simplest terms the plan contemplates the purchase by the city of the Interborough Rapid Transit and Manhattan Elevated and recapture of the Brooklyn-Manhattan Transit Corporation's subway line. The city would buy Interborough stock at 30, guarantee 2½ per cent on Manhattan modified guaranteed stock, or as alternative pay 50 a share, exchange the city's 3 per cent bonds for $154,000,000 of I.R.T.'s first and refunding 5s, $34,000,000 of city 4 per cent bonds for $34,000,000 of Interborough's ten-year 7 per cent gold notes, and city 3 per cent bonds for I.R.T.'s $10,500,000 ten-year 6 per cent notes. The reduction in fixed charges on I.R.T. and Manhattan under this plan would be $7,500,000. The cost to recapture the B.-M.T.'s subway lines would be $52,728,000. Samuel Untermyer, special counsel for the commission, is said to have held conferences with members of J. P. Morgan & Company representing Interborough bondholders. The plan would merge the I.R.T. and B.-M.T.'s recapturable subway lines with the new city system now being constructed. A corporation would probably be formed to operate the new system, with the city having a substantial representation on the directorate.

Twenty-five Year Men Gather

The fifth annual reunion of the 25-Year Club of the East St. Louis & Suburban Railway was held recently in East St. Louis, Ill. The business meeting was in the office of President W. H. Sawyer, an honorary member of the club, and at this gathering fifteen new members were admitted and resolutions of respect to the memory of John Burke were adopted. Following this gathering the club members traveled in company buses to Loew's State Theater in St. Louis, Mo. After the show dinner was served at the Missouri Athletic Association. The place cards were checks for $25 each. Two of the charter members of the club are dead, but eight others were present. One of the honorary members of the club is dead, but the others present were W. H. Sawyer and F. E. Allen. Nine of the men admitted to membership May 18 are motormen, one a division superintendent, one an assistant superintendent of transportation, one a bus operator, and two are conductors and motormen.

Municipal Railway Proposed to Be Resubmitted in San Francisco

City officials of San Francisco, Cal., are shaping plans for another bond election in November linked with the regular municipal election, at which the Municipal Railway extensions and the Spring Valley purchase, defeated at the recent election, will be submitted again. As things stand now the city is faced with the problem of a municipal railway tunnel and no money to run the railway through it, the same situation with respect to the Bernal cut and no place to put Hetch Hetchy water when it arrives.

City Engineer M. M. O'Shaughnessy is reported to have said:

> The results on the Spring Valley and railway issues showed clearly that the people of San Francisco are in favor of these projects. Both received a substantial majority, but by reason of the light vote failed to receive the two-thirds majority required for bond projects. They should be resubmitted at the earliest opportunity.
>
> We now have a tunnel with no funds to finish the railway. A portion of the line can be laid, but it cannot be completed. There is no money to purchase the rolling stock, and no place to put it if we buy it. We cannot borrow equipment from other municipal lines as all are used to capacity.
>
> As to the Bernal cut, for which the people voted $1,400,000 bonds, we will proceed at once with the construction of both the vehicular roadway and roadbed for the railway tracks. But by failure to pass the railway bonds the voters leave us without funds to lay the tracks.
>
> Our plans are drawn for the cut, we have purchased $250,000 in rights-of-way, and will begin actual excavation in 90 days.

Unusual Turn Taken by Seattle Suit

Litigation over the question of the priority of the Seattle Municipal Railway purchase bonds came to a sudden but temporary halt in the federal court recently when the clerk of the court signed a *pro confesso* order on motion of the Puget Sound Power & Light Company in the suit of John G. Von Herberg against the city of Seattle, Wash., and its financial officers, in which suit the newer company had appeared as a cross-defendant. The order, however, is subject to suspension, alteration or rescinding by the trial court, on a proper showing. In a cross-complaint the power company had contended that before the transfer of the railway to the city the Twichell case was carried to the State Supreme Court and the contract held valid, giving the bondholders a first lien on gross revenues of the system. Mr. Von Herberg had attempted to have labor costs adjudged the first lien.

In the motion of the *pro confesso* order the power company recited that Mr. Von Herberg had failed to answer, plead or demur to the cross-complaint within 30 days, as required under the court rules. The order simply means that by his failure to make an answer Mr. Von Herberg is held to acknowledge that the allegations of the cross-complaint are true and that the bondholders have first lien against revenues.

The fact that the court can set aside the order or alter it leaves the way open for further proceedings, but the present status of the litigation in the federal court is that the power company has won its contentions and Mr. Von Herberg is eliminated.

Wage Negotiations in Chicago in Final Stage

Negotiations on the wage question between representatives of the union of surface lines and elevated trainmen and company officials in Chicago entered their final stage during the week ended June 18, when meetings to talk over the demands of the men were held by officials of both transit organizations.

At a referendum of the surface lines men the union officials were clothed with authority to declare a strike unless the demands of the men were met by the company. The poll resulted in 162 voting against the matter of clothing the union officials with authority to act for them, out of a total of 11,961 votes cast. The elevated employees vote resulted in nearly as overwhelming a majority in favor of the same proposal.

Both unions are asking a wage increase of 15 cents an hour, the present scale on the surface lines being 75 cents and on the elevated 77 cents. In addition the surface lines men ask a paid insurance policy of $1,000. Surface lines men, it is said, have agreed not to compromise on an increase of less than 5 cents an hour, bringing their scale to 80 cents and restoring a 10-cent cut made in 1922, when fares were reduced from 8 to 7 cents.

Changes in working condition are also asked by the two unions.

William D. Mahon, international president of the union, has been in Chicago for the past week, taking an active part in the negotiations.

Officials of the Surface Lines point to the federal receivership under which they are operating as militating against any wage increase. The company is also operating under temporary franchises.

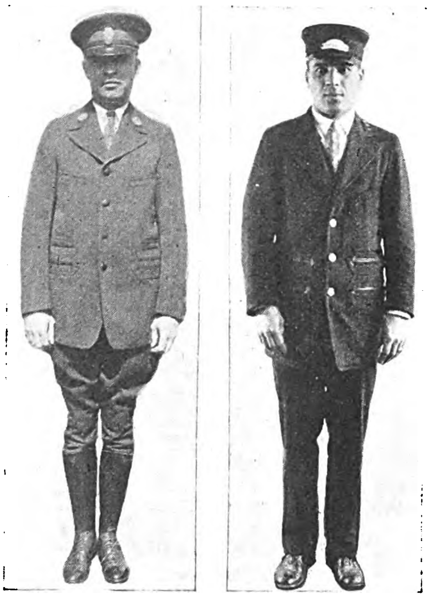
Tacoma Marking Time on Fares and Transit Report

In order to hasten the time when the Tacoma Railway & Power Company, Tacoma, Wash., may submit a written answer to the report of Kenneth G. Harlan, city utilities engineer, upon the operations and finances of the company, submitted some six weeks ago, the City Council has authorized Mr. Harlan to confer with the company accountants about the figures from which he made certain deductions. Richard T. Sullivan, manager of the railway, told the Council the company can have a written answer ready within 60 days. Mr. Harlan recommended to the Council that no attempt be made to discuss his report with company officials until after an answer in writing had been made by the company and he had had time to reply to this. The discussions could then be directed better. Mayor M. G. Tennant indorsed this.

The question of the fare basis to be used in the 60-day period allowed for the company reply has been left open for a meeting to be held on June 28. Mr. Harlan reported that the average fare under the new fare basis, with the weekly ticket at 30 cents, allowing rides at 5 cents, tokens at three for 25 cents and 10-cent cash fares, was 7.4 cents for the weeks examined. He estimated the increased income for the company at 6 to 7 per cent. The possibility of reducing the ticket to 25 cents has been discussed, but it is felt that data are still too meager to permit a decision. The present schedule will expire on July 2.

Outfits of New Design for New Jersey Men

Railway and bus operators of the Public Service Railway and the Public Service Transportation Company, Newark, N. J., are soon to be attired in natty new uniforms of a design and color entirely different from those now worn. The change is to become effective at once for new men entering the service and will be adopted by present employees as their old uniforms wear out and they buy new ones.



The new and the old on the Public Service Railway

The familiar blue uniform will give way to a uniform of heavy whipcord, olive green in color. The official Public Service design will be embroidered on each side of the collar. Breeches and black puttees or long trousers will be worn.

An innovation is the adoption of an army officer's style of cap, of the same material as the coat and breeches, but with brown visor and strap. A nickeled silver badge of attractive design will replace the enameled badge now worn on the cap.

Temporary Fare Increase Denied in Los Angeles

The Los Angeles Railway, Los Angeles, Cal., was denied a temporary increase in fares to 6 cents by the state Railroad Commission on June 20. This request was made by the company pending a decision on its application for a permanent 7-cent fare to replace the present 5-cent fare. The application for the permanent 7-cent fare is scheduled to be heard by the commission on Aug. 9.

Rehearing Ordered on Albany Fares

The Public Service Commission of New York on June 23 ordered a hearing on the application for a rehearing filed by Albany, Troy and other municipalities on the order of the commission made on June 14 increasing fares on the lines of the United Traction Company. The hearing will be held at Albany on June 28. The new tariff goes into effect July 1.

Injunction Against Birmingham Rerouting

A temporary injunction has been granted restraining the Birmingham Electric Company, Birmingham, Ala., from abandoning its Avenue C line, in accordance with the provisions of the traffic survey of Ross Harris, traffic expert. The petition was filed by an attorney acting for property owners along the line. J. S. Pevear, vice-president of the company, says that the Birmingham Electric Company "is merely carrying out the traffic survey, and this injunction will have no effect on the remainder of the traffic survey, which will go into effect June 26." Under this traffic survey a number of railway lines are to be rerouted, especially in the downtown loop section. The city is not made a party to the suit.

Department Store Owners Warned of Parking Menace

Unless drastic steps are taken to improve traffic conditions in Chicago and other large cities, the time will soon come when the inconveniences to shoppers will be so great that they will be virtually prevented from entering downtown shopping and business districts.

That is the opinion of Miller McClintock, director of the Albert Russel Erskine Bureau of Street Traffic Research, as given to members of the National Retail Dry Goods Association at their convention in Chicago, recently.

Mr. Mitten Not to Participate in Brotherhood Banking

Dr. A. A. Mitten, vice-president of Mitten Management, Inc., sent the following telegram on June 24 to William B. Prenter, president of the Brotherhood of Locomotive Engineers, at Cleveland, Ohio:

> The apparent impossibility of there being a sufficiently unanimous accord of the convention in approval prompts us now to request that the proposition by which our organization agreed to assist in the development of your banks and at the request of your advisory board, Mr. Mitten personally act as trustee in the working out of the venture and your other slow assets over an extended period be now withdrawn from further consideration by your convention.

It had previously been reported in the daily press that negotiations were under way between the Thomas E. Mitten interests of Philadelphia and the Brotherhood of Locomotive Engineers, looking toward a consolidation of the banking and financial interests of the brotherhood with the Mitten "men and management" interests.

Franchise Agitation Renewed in Omaha

Agitation has been renewed for another election to determine the status of the Omaha & Council Bluffs Street Railway with respect to the future franchise in Omaha. Business men feel that the city's standing abroad would be helped by a new franchise with definite limitations rather than to allow the matter to hang on until the federal courts have passed on the application of the trustee for the bondholders to have the franchise declared perpetual. A counter proposal by a group headed by Former Mayor Ed P. Smith is that no franchise be granted until the company agrees to sell to the city the bridge over the Missouri River across which its cars operate between the two cities and on which a large and profitable vehicular traffic is handled on a toll basis.

The city wants a free bridge. Under a law shortly to become effective the city would have the right to buy or build one, if the voters so authorize. Mr. Smith urges that the city buy the company bridge instead of building a competitive structure. The railway is understood to be reluctant to divest it of ownership of the structure, particularly in view of the present unsatisfactory earning status of its railway lines.

Valuation Figures for Louisville Expected Soon

The valuation of the property of the Louisville Railway, Louisville, Ky., now being completed by John A. Beeler, New York, is expected to be ready on July 15. This valuation will become the basis on which the Board of Works will regulate fares, under the franchise granted on Sept. 21, 1926, in which it was agreed that the city, through the Board of Works, would arrange for the appraisal of the properties.

Broadcasts Safety and Courtesy

The Nashville Railway & Light Company, Nashville, Tenn., has started a summer series of broadcasting hours through its school for safety and courtesy. Brief outlines of work being done by the railway and light department in furthering these desiderata among its employees were given by J. P. W. Brown, vice-president and general manager; Superintendent Davis of the railway, and W. A. Brown, safety director of the company. The programs, including musical numbers, will be broadcast every two weeks.

$143,175 Verdict Awarded in Washington Case

The Washington Railway & Electric Company, Washington, D. C., has been awarded judgment by Chief Justice Walter I. McCoy in the Circuit Court against the Washington, Baltimore & Annapolis Electric Railway for $143,175 and interest as the amount due under an operating agreement between the two roads by which the Annapolis company uses the tracks of the Washington company. Neither road is satisfied with the verdict, as both noted appeals to the Court of Appeals. The Washington company sued for $275,000. The Annapolis company admitted owing only $15,440. The case was tried twice without a jury. Justice Hoehling heard the case the first time and ordered a retrial without deciding any of the issues.

Boston Looks Ahead to Fall Courses

Opinions are many and honest in *Co-operation* on how the educational courses conducted by the Boston Elevated Railway, Boston, Mass., are regarded. In the May issue of this paper many comments are printed which speak for themselves. This forum is considered of value not only in regard to the action of the committee on education for next fall's program but also in assisting employees to choose courses best suited to their needs. In the discussion the chief electrician, maintenance department, has something to say about "Investing Savings"; the foreman, armature shop, expresses his views on "Foreman Conferences," and the general storekeeper passes judgment on the course in "Public Speaking."

Wage Negotiations in Connecticut

Proposals made by employees of the Connecticut Company, New Haven, Conn., for a wage of 75 cents an hour for operators of two-man cars and 15 cents additional for operators of one-man cars have been rejected by the Connecticut Company. The company has likewise rejected the proposition that the working schedule be fixed at eight hours a day instead of nine. It is considered likely that the men will continue their conferences and submit a compromise proposition.

President Punderford told the committee that the company could not afford to grant the raise in wages. It has paid no dividend since 1916 and is reluctant to increase fares, a contingency that could hardly be escaped under any upward revision of the wage scale.

"Low-Cost Riding"

In an eight-page pamphlet which it has issued the Beaver Valley Traction Company, New Brighton, Pa., sends a message to its patrons on the elements of low-cost riding yesterday and today. According to this company, Dad will tell you how the coming rails made low-cost riding possible. Now, according to this booklet, the question is being asked, will the street cars be replaced by the bus? The Beaver Valley Traction Company management states that as an auxiliary to the street car the bus is proving its value, but for carrying large crowds quickly and economically the street car is indispensable. The bus and railway management in the Beaver Valley territory is bound by the closest co-operation and its common end is to give the people of the Beaver Valley district a transportation service which is as near perfect as anything can be which is humanly operated.

Foreign News

Faster Cars in London

The Metropolitan Electric Tramways, which operates an extensive system in Middlesex and has a through running arrangement over the northern lines of the London County Council Tramways, London, England, has begun to equip its cars with new motors capable of giving a maximum car speed of 30 m.p.h., but the highest speed allowed by the Ministry of Transport is 20 m.p.h. This is an increase of 4 m.p.h. on the formerly permitted maximum. Increase in average speed will be aided by more rapid acceleration and by the abolition of a number of stopping places.

Rail and Road Competition in Britain

Transportation on the highways in Great Britain of motor vehicles carrying both passengers and freight has become so enormous as to be severely competitive with the railways according to a recent appeal of railway representatives. As a result of this increased traffic, a committee representing the main railways of Great Britain and three trade unions of railway employees, laid before Winston Churchill, Chancellor of the Exchequer, a weighty memorandum appealing for more parliamentary control over the highways. The government, Mr. Churchill said, is considering the question of block grants instead of percentage grants for road maintenance. And he pointed out that last year's budget showed by increased taxation on road motor vehicles that measures had been taken to meet the request of railway representatives.

Tramways' Overhead in England Goes to Relief of Taxpayers

Tramway revenue of £207,000 for the last 25 years has been contributed by Newcastle-on-Tyne toward tax relief of the community. The amount received for the last several years has been £14,000, meaning a reduction of 1½d. per £1 on the taxes. It has been the ambition of municipal tramway authorities in all England to make profits substantial enough to reduce the local taxes levied on the various communities. Most of the tramways, however, instead of showing a profit are working at a loss, and it is believed that this year's showing, especially, is dubious because of the general effect of the coal strikes during 1926.

Net Income Lower.—For the year ended Dec. 31, 1926, the gross revenue of the Berlin Electric Elevated & Underground Railways, Berlin, Germany, was $7,171,973, against $5,730,242 in 1925. Expenses and taxes increased from $3,024,430 to $4,031,296 in 1926. After the consideration of depreciation and amortization, the net income for 1926 was $1,743,599, against a net in 1925 of $2,021,785.

Recent Bus Developments

Railway and Coach Terminal Opened at Michigan City

A new $200,000 union station for the joint use of motor coach and electric railway passengers was formally opened at Michigan City, Ind., on May 21 by the Chicago, South Shore & South Bend Railroad and Shore Line Motor Coach Company. The dedication of the big structure attracted a throng of more than 12,000 persons from all parts of northwestern Indiana and southwestern Michigan. The station project, including an inclosed motor coach loading shed and a large modern brick and steel garage adjoining, represents an investment of more than $200,000.

The station proper has a handsome façade of buff-colored terra cotta, with side walls of brick and large plate glass windows and revolving doors. It is a two-story structure, the floor above the main waiting room providing office space for officials of the motor coach company. The interior of the station is finished in light colors, with marble columns and attractive trimming. A luxuriously furnished ladies' lounge and large smoking rooms for men are located adjacent to the waiting room.

A steel-canopied loading shed, accommodating nine large motor coaches at one time and affording protection to passengers in inclement weather, is directly connected with the waiting room. The terminal is so arranged that motor coaches will always be kept off the public streets when receiving or discharging passengers.

The garage provides space for the servicing and storing of 30 large motor coaches, with three repair pits, a storeroom for tools and materials and other necessary facilities.

The station was rushed to completion in the record time of twelve weeks in order that it might care for the heavy increase in rail and motor coach traffic during the summer months. The new station will be used as a transfer point from train to bus by thousands of persons traveling between Chicago and the Michigan resort region.

Service Between Dallas and Fort Worth

Alfred F. Townsend, vice-president and general manager of the Northern Texas Traction Company, Fort Worth, Tex., announces that his company is to start bus service between Dallas and Fort Worth supplementing the regular interurban railway service. The new service is to be instituted as soon as a permit is granted by the Texas Railroad Commission, authorized to supervise and regulate bus service in Texas under the statute which went into effect on June 14. Mr. Townsend's company will purchase ten parlor buses, at a cost of about $10,000 each, and will operate these buses on a 30-minute schedule daily from 6:30 a.m. to 8:30 p.m. Bus terminals will be erected in both Dallas and Fort Worth, probably in connection with the interurban terminals. It is to meet growing bus competition between the cities that the new service is to be established.

Decision Expected in Louisville Case

A decision is expected shortly in the case of the Peoples Transit Company, a bus operating organization, against the Louisville Railway, carried by the former to the Court of Appeals, after the Jefferson County Court held that the railway had the passenger carrying franchise over streets on which it has railway lines in Louisville. It will be recalled that an injunction was secured against the Peoples company restraining it from operating bus lines in competition with the railway and stopping the buses after they had started. The case was carried to the upper court some months ago. In the meantime the Peoples company is at a standstill.

Buses Running Between Buffalo and Port Colborne

With the formal opening of the new $4,500,000 Peace Bridge across the Niagara River connecting Buffalo with Fort Erie, Ont., the International Bus Corporation, a subsidiary of the International Railway, Buffalo, started a new bus line between Shelton Square at Buffalo and Fort Erie Plaza at Fort Erie, Canada. Eventually, the International Bus Corporation will operate an interurban line between Buffalo and Port Colborne, Ont. Ten-minute service is being maintained on the new Peace Bridge bus route. Only through passengers can be carried on this line as the company has no franchise to operate the line in the city of Buffalo. By entering Canada, the new bus line does not come within the jurisdiction of the New York State Public Service Commission. De luxe gas-electric buses carrying 27 passengers are being operated on the new interurban division into Canada. The fare from Shelton Square to Fort Erie Plaza is 20 cents each way, of which 10 cents represents the bridge toll and goes to the Buffalo-Fort Erie Bridge Corporation. Ferry service formerly handled the traffic across the river at Buffalo.

Financial and Corporate

Merger Plans Maturing in Indiana

The proposed consolidation of the Central Indiana Power Company and Terre Haute, Indianapolis & Eastern Traction Company and certain of their subsidiaries into the Indiana Electric Corporation involves the readjustment and exchange of five bond issues and six stock issues now outstanding in the hands of the public. The face value of the bonds to be readjusted is about $11,900,000 and par value of stocks $27,600,000, or a total of $39,500,000.

All these issues are represented by committees, which have designated depositaries and asked for deposits. The percentage of bond issues deposited at latest reports ranged approximately from 60 per cent to 90 per cent. Five stock issues deposited range from 63 per cent to 95 per cent. About 50 per cent was deposited of the sixth issue, one of the three smaller stock issues. The average percentage deposited by holders of all eleven stock and bond issues was 83 per cent.

A plan and agreement for the consolidation has been drawn up in complete form and has been submitted to the eleven committees, most of which have already taken favorable action. If all committees approve and their decision is accepted by sufficient depositors the agreement will go before the Public Service Commission of Indiana. If that body approves it and consolidation is effected, material benefits are expected therefrom, since one company has ample generating facilities and favorable power contracts, while the other has a load in excess of its efficient generating capacity.

The Indiana Electric Corporation when formed will be a subsidiary of the American Public Utilities Company, of which Samuel Insull is chairman and Martin J. Insull president.

Kansas City Securities Being Distributed

Notice has been given that the new securities are ready for distribution provided for in the plan and agreement dated June 1, 1925, for the reorganization of the Kansas City Railways, Kansas City, Mo. As provided in the plan, a new corporation, named the Kansas City Public Service Company, has been organized under the laws of Missouri and has acquired the properties and assets in the state of Missouri of the Kansas City Railways. The Missouri corporation also owns all bonds and stocks (except directors' qualifying shares) of the Wyandotte Railways, its Kansas subsidiary corporation, which owns the fixed physical property in Kansas. The railway property in Kansas is leased to the Missouri corporation, which conducts unified operations over all lines. A new railway franchise, extending to Jan. 1, 1957, has recently been granted to the Public Service Company by the city of Kansas City, Mo., upon terms believed to be fair and just to the company and the city.

The Kansas City Public Service Company has an authorized capitalization of 150,000 shares of non-par prior preferred stock, 250,000 shares of non-par preferred stock and 250,000 shares of non-par common stock. It has issued, as provided in the plan, 83,364 shares of preferred stock, series A, and 182,645.4 shares of common stock, plus an additional 1,000 shares of common stock issued at time of incorporation. The company has also executed a mortgage and deed of trust, dated July 1, 1926, upon its property and has issued thereunder, as provided in the plan, $12,465,200 principal amount of first mortgage 6 per cent gold bonds, series A. Issuance of these securities has been approved by the Public Service Commissions of Missouri and Kansas. The preferred and common stocks of the company (except directors' and inspectors' qualifying shares) have been deposited under a voting trust agreement extending for five years from July 1, 1926, the voting trustees being Melvin A. Traylor, J. K. Newman, William G. Woolfolk, George W. Davison and Powell C. Groner.

Volume of Business Grows

Six Per Cent More Passenger Traffic Carried on Chicago Rapid Transit Lines in 1926—Net Income Greater—Property Being Used More Intensively

THE business of the Chicago Rapid Transit Company, Chicago, Ill., in 1926 exceeded in volume that of any previous year in the history of the elevated system, according to the company's annual report.

A total of 228,812,766 passengers was carried, an increase of 12,767,191 over the previous year. In the month of December 20,980,331 riders were handled, the greatest number ever carried in a single month. Passenger revenues, because of the large increase in the number of customers transported, rose to $18,891,998, an increase of $1,105,523. The average rate of fare received was 8¼ cents. Gross revenues, inclusive of both the amount received from fares and from non-operating revenues, were $20,420,659, an increase of $1,138,771. Net income for the year was $1,117,632, an increase of $74,231. Dividends paid on the company's prior preferred stock totaled $375,740. Taxes were $1,663,456, or approximately 4½ times the amount paid to the company's stockholders.

INCOME STATEMENT OF THE CHICAGO RAPID TRANSIT COMPANY

For the year ended Dec. 31, 1926

Passenger revenue		$18,891,998
Other transportation revenue		1,259,156
Gross operating revenue		$20,151,154
Operating expenses:		
Maintenance of way and structure	$1,922,496	
Maintenance of car equipment	1,545,600	
Power	2,119,020	
Conducting transportation	7,228,708	
General and miscellaneous	1,318,373	
Total operating expenses (*a*)		$14,134,199
Net operating revenue		$6,016,955
Taxes, city compensation		1,663,456
Operating income		$4,353,499
Non-operating income		269,504
Gross income		$4,623,003
Deductions:		
Rentals	$1,039,525	
Interest on mortgage debt and equipment obligations	2,367,825	
Other interest (*b*)	32,260	
Amortization of discount	65,760	
Total		$3,505,371
Net income for year 1926		$1,117,632
SURPLUS ACCOUNT		
Balance, surplus Dec. 31, 1925		$1,731,713
Net income for the year ended Dec. 31, 1926 (as above)	$1,117,632	
Less dividends paid on prior preferred stock	375,740	
Surplus earnings for the year unappropriated		$741,891
		$2,473,604
Miscellaneous debits and credits (Net)		40,813
Surplus, Dec. 31, 1926		$2,514,418

(*a*) Total operating expenses include $316,086 credited to retirement reserve.

(*b*) No interest declared or paid on adjustment debenture bonds.

The company operated a total of 57,486,898 car-miles during the year, compared with 54,525,633 car-miles in 1925.

The report says the substantial increase in business was made possible through the intensive use of the company's property. Station platforms were increased in length and eight-car trains were placed in operation on most of the lines during the rush-hour periods.

The amount expended for extensions and improvements in 1926 was $1,574,979. In addition a large amount of maintenance and renewal of structures and equipment was done at an expense of $3,219,381. Important improvement work included extension of Rapid Transit Lines service to the western suburbs of Maywood, Bellwood and Westchester, this being accomplished through a trackage lease with the Chicago, Aurora & Elgin Railroad, whereby use is made of the latter's tracks; practical completion of extension of station platforms, so as to permit of eight-car train operation; the starting of construction work on the new $250,000 Wells Street Terminal Building, which will be of great convenience to west side residents, and the letting of a contract for the first unit of new shops to be located at Niles Center.

TRAFFIC AND REVENUE FROM FARES ON THE LINES OF THE CHICAGO RAPID TRANSIT COMPANY

	1924	1925	1926
Customers carried	212,901,024	216,045,575	228,812,766
Per cent increase	•	1.48	5.91
Revenue from fares	$17,656,082	$17,786,474	$18,891,998
Per cent increase		74	6.22

INCOME ACCOUNT COMPARED

	1924	1925	1926
Gross earnings*	$18,775,933	$19,281,888	$20,420,660
Maintenance, renewals	3,537,147	3,222,965	3,468,097
Conducting transportation, power, miscellaneous	10,222,503	10,122,229	10,666,102
Taxes	1,407,460	1,622,315	1,663,457
Total expenses	15,167,110	14,967,509	15,797,656
Net earnings	3,608,823	4,314,379	4,623,004
Fixed charges	2,807,448	3,270,978	3,505,372
Net income	$801,375	$1,043,401	$1,117,632

*Includes revenue from fares and rentals from company properties.

During the year the company was given the first award in a national public relations contest conducted under the sponsorship of the American Electric Railway Association for having done most during the year to win the good will of its customers.

There were 6,061 persons in the employ of the company at the end of the year. Continuing its policy of providing group insurance for its employees, the company extended the scope of this method of protection to provide sick benefits of $20 a week and also obligated itself to pay the full cost of the premiums for $1,000 death benefit for each employee, with double indemnity in case of accidental death.

Besides indicating the company's progress during 1926 in its educational activities and accident prevention work the report is a chronology of the rapid transit lines.

The financial reorganization of all the elevated railroads of Chicago was perfected in January, 1924. At that time they were combined in one company under the present name, the Chicago Rapid Transit Company. The progress made since then is illustrated by the accompanying comparison of figures for the three years.

Surplus for Washington-Baltimore Interurban

For the year ended Dec. 31, 1926, the Washington, Baltimore & Annapolis Electric Railroad, Baltimore, Md., realized a net income of $24,106, but on account of profit and loss net credits the company finished the year with a surplus of $32,071, against $245,242 in 1925. These facts were contained in the annual report to the stockholders. The decline in the number of revenue passengers carried is noted as follows:

1926	3,871,600
1925	4,021,766
1924	4,429,387
1923	4,644,472
1922	4,570,996
1921	4,692,860

One per cent of the gross operating revenue was credited to "Reserve for Injuries and Damages." The balance in reserve account on Dec. 31, 1926, was $115,333. The disbursements in payment of accident claims, suits, judgments and other expenses of the department amounted to 1.48 per cent of the gross operating revenues.

Car-miles operated totaled 4,479,856; of this total 4,209,483 were passenger-miles, 259,888 freight and 10,485 service-miles.

SUMMARY OF INCOME AND PROFIT AND LOSS OF THE WASHINGTON, BALTIMORE & ANNAPOLIS ELECTRIC RAILWAY FOR THE YEAR ENDED DEC. 31

		1926		1925
Operating revenue		$2,564,047		$2,694,910
Operating expenses prior to provision for depreciation		1,826,038		1,994,723
Net operating revenue prior to provision for depreciation		$738,009		$700,187
Taxes assignable to railway and other operations		121,713		128,867
Operating income prior to provision for depreciation		$616,295		$571,319
Non-operating income (net)		29,853		27,516

$55,563,737 for New York Subways

Contracts for This Sum Let in 1926 by Transportation Board—$76,498,606 in Awards Authorized in Two Years

Contracts for subway construction amounting to $55,563,737 were awarded by the Board of Transportation of New York City in 1926. During the 2½ years of its existence the board has awarded a total of $150,324,118 in subway construction contracts, of which $10,100,690 was awarded in the last six months of 1924 and $84,659,691 in 1925. The route mileage of the construction contracts awarded in 1926 is 5.82, of which 4.32 miles is for the new city system and 1.5 miles for the Brooklyn-Manhattan Transit system. The total route mileage of contracts awarded in the 2½ years is 16.12; 12.52 miles for the city system and 3.6 miles for the B.-M.T.

The awards made in 1926 are divided as follows:

City's new subway system	$47,736,576
Interborough system	1,526,604
B.-M.T. system	5,956,724
Miscellaneous	343,833
Total	$55,563,737

Payments for the new city-owned rapid transit facilities during 1926 amounted to $52,095,502.90, divided as follows:

For city's new system	$41,847,613
For Contract 1 (I. R. T.)	96,714
For Contract 3 (I. R. T.)	9,099,931
For Contract 4 (B.-M. T.)	7,952,754
For alterations	101,307

The total rapid transit disbursements approved by the board from July, 1924, to Dec. 31, 1926, amounted to $76,498,606.26, divided as follows:

For city's new system	$49,032,133
For Contract 1 (I. R. T.)	182,312
For Contract 2 (I. R. T.)	668
For Contract 3 (I. R. T.)	9,099,431
For Contract 4 (B.-M. T.)	17,886,668
For alterations	296,891

The $47,736,576 in awards for the construction of the city's new subway system last year embraced eight major contracts amounting to $47,671,644. For borings, removal of buildings, reinterment of bodies in Nagle Cemetery on the Harlem River yard site contracts were awarded aggregating $64,932.

There are now under contract for the city's new subway system twenty-five sections of the Washington Heights-Central Park West-Eighth Avenue-Sixth Avenue-Church Street line, extending from the vicinity of Fulton Street to the northerly end of Manhattan Island.

Contracts for the East River tunnel from Fulton Street, Manhattan, to Cranberry Street, Brooklyn, are nearly ready for advertising. As soon as the injunction action instituted by Jasper A. Campbell, president of the Central Park West and Columbus Avenue Association, is decided by the Court of Appeals, the board will take action toward awarding the contracts for the 53d Street tunnel under Welfare Island to Long Island City, where the Brooklyn and Queens lines will join.

Another major contract awarded by the Board of Transportation last year was $1,063,115 for the Coney Island yard and shops of the B.-M.T. system.

Of this amount, $266,900 was for the West End line connection to the yard, $69,247 for the Culver line connection, $271,292 for grading the yard site, $125,000 for fill, $103,019 for tracks for the Sea Beach and West End line connections and $52,759 for steel for the main repair shop.

The board also awarded in the year four contracts aggregating $743,498 for lengthening the platforms of forty stations on the B.-M.T. system in Brooklyn and Manhattan. These platforms, when lengthened, will be 539 ft. long, and will accommodate eight-car trains, increasing the passenger-carrying capacity of each train 33⅓ per cent and standardizing the length of all trains in service on the B.-M.T. subway system.

Other awards were $570,974 for additions to the Lenox Avenue yard of the Interborough system, $181,806 for the completion of the Corona-Flushing line, which will be ready for operation to Main Street, Flushing, this summer, and $178,712 for tracks and for finishing the Times Square station of the Queensboro subway at 41st Street.

The board awarded a total of $4,128,471 for the completion of the Fourteenth Street-Eastern subway and its connection with the Broadway elevated line in East New York.

Under contract No. 3 with the Interborough Company, the board awarded a $218,919 contract for the construction of a transfer connection between the subway and elevated lines at 149th Street and Third Avenue, the Bronx, and one of $116,723 for an additional passageway at Canal and Varick Streets to connect with the approach to the New York and New Jersey vehicular tunnel.

In the year just ended, the board acquired by private purchase or by condemnation ownership of 176 parcels of real estate in Manhattan, Brooklyn and the Bronx with a total area of about 43 acres. Permanent easements were acquired under 38 other parcels and temporary easements were acquired at many points to provide access to the work of subway construction. The total value of the rights in real property acquired is estimated at about $10,500,000, a closer approximation being impossible because the courts in many instances have not yet fixed the awards in condemnation proceedings.

Properties at Morgantown Sold

Signing of a contract by the Monongahela West Penn Public Service Company for the purchase of the physical property of the West Virginia Utilities Company, Morgantown, W. Va., was announced at Fairmont by Capt. George M. Alexander, president of the company. Immediately after the announcement Captain Alexander left the city and his bare statement of the facts could not be amplified by other officials of the concern. No reference to the purchase price was made, but estimates by persons familiar with the property place the sale price at $4,000,000.

The announcement by the head of the Monongahela West Penn Company follows:

> According to an announcement by Capt. G. M. Alexander, president, the Monongahela West Penn Public Service Company through one of its subsidiaries has signed a contract for the purchase of all the physical property of the West Virginia Utilities Company, located in and around Morgantown. These properties include the water, natural gas, railway and electric light and power systems now a part of the West Virginia Utilities Company.
>
> Morgantown and the growing communities tributary to it have a population of more than 40,000 and for the last five years have shown a most substantial and consistent growth. It is the seat of the state university, with an attendance of some 3,000 students; it is also the center of the most recent extensive soft coal developments in the state of West Virginia.
>
> Captain Alexander stated that the Monongahela West Penn Public Service Company would probably take over the operation of the Morgantown properties some time in July.

The statement by President Alexander indicates that the property is being purchased by a subsidiary of the Monongahela West Penn, but it is not known whether it will be operated under that name.

Net Income of Chicago Railways Improves

Net earnings of the Chicago Railways, Chicago, Ill., in the year ended Jan. 31, 1927, were $1,292,673. This is the sum available for interest on the adjustment income bonds, against $1,061,548 in the preceding year. The surplus for the year after all interest and other charges was $1,092,674, against $961,548 in the preceding year. These facts are included in the nineteenth annual report of the company.

The Chicago Railways, which owns the north and west side street car lines and is the largest operating unit of the Chicago Surface Lines group, went into receivership shortly after the expiration of the franchise at the end of January. This statement will have, therefore, an unusual amount of interest. Of particular interest in the balance sheet will be a comparison of property values and bonded debt. The city purchase price of the properties came to $94,438,640, against a total debt of $103,854,255. The road, equipment and franchise are carried in the

*The three index numbers marked with an asterisk are computed by Mr. Richey, as follows: Fares index is average street railway fare in all United States cities with a population of 50,000 or over except New York City, and weighted according to population. Street Railway Materials index is relative average price of materials (including fuel) used in street railway operation and maintenance, weighted according to average use of such materials. Wages index is relative average maximum hourly wage of motormen, conductors and operators on 136 of the largest street and interurban railways operated in the United States, weighted according to the number of such men employed on these roads.

SURPLUS ACCOUNT OF THE CHICAGO RAILWAYS JAN. 31, 1927

Surplus, Jan. 31, 1926		$4,337,018
Add: Net income for the year		1,292,674
		$5,629,692
Deduct: interest on adjustment income bonds		
For year ended Jan. 31, 1926 (paid May 1, 1926)	$100,000	
For year ended Jan. 31, 1927 (payable Feb. 1, 1927)	100,000	200,000
Surplus Jan. 31, 1927		$5,429,692

balance sheet at the sum of $101,035,875.

The report states that the Chicago Railways during its twenty years of operation under the ordinance of 1907 and subsequent ordinances paid to the city of Chicago $24,589,605, as 55 per cent of the divisible net earnings. President Henry A. Blair said that there was expended during last year, as in the past, more than the ordinance requirements on maintenance and repairs, with the result that the physical property was in excellent condition.

Net Earnings of Illinois Power & Light Up 11 Per Cent

Gross earnings from operations of the Illinois Power & Light Corporation, Chicago, in 1926 were $31,189,628, an increase of more than 7 per cent over last year. The net earnings were $11,808,639, 11 per cent greater than in 1925. Dividends on all of the stocks outstanding were earned on a substantial basis, and a protective margin remained after the full payment of dividends. The balance sheet shows a very satisfactory financial and credit position at the end of the period.

Intensive efforts have been continued to increase the freight, express and through passenger business of the trunk line electric railroad of the Illinois Traction System connecting Danville, Champaign, Decatur, Bloomington, Peoria, Lincoln and Springfield with Edwardsville, Granite City, Madison and St. Louis. This property was originally designed as a passenger carrying line, but great strides have been made during the last four years in the development of other business, not only interchanges of freight with practically all of the steam railroads. During 1926 more than 3,000 tons of 90-lb. rail was laid on the main division, 40,000 tons of gravel ballast was placed and more than 60,000 creosoted ties were installed.

New large type electric locomotives and new cars were put in service, all of which were constructed at the Decatur shops. A considerable amount of overhead trolley was renewed, additional feeder lines installed, the capacity of three railroad substations was doubled on the main line, and crossing signal light installations increased. The capacity of the freight house at Peoria was materially increased and new or extended sidings installed along the line to accommodate larger freight business. On the Illinois Valley division additional capacity for railroad service was installed at the LaSalle power house and improvement made in the method of furnishing energy for the operation of the road.

Portions of the Illinois Central and the Wabash Railroad tracks around Champaign and Urbana were electrified and operating rights secured thereover, thus providing a freight belt around these cities. Construction of a new freight house was started at Champaign, to be finished some time in 1927.

On the St. Louis, Troy & Eastern Railroad, operated by steam, additional large locomotives and all-steel hopper bottom coal cars were placed in service to handle additional business.

Improvements and changes have been continued in the city railway lines to effect economies of operation. The use of buses has been increased to replace certain unprofitable railway lines and to furnish service where the growth of the community has extended beyond existing car tracks. A number of garages were completed or enlarged during 1926 in order to handle the buses efficiently.

CONSOLIDATED STATEMENT OF INCOME AND EXPENDITURES OF ILLINOIS POWER & LIGHT CORPORATION

(Year Ended Dec. 31, 1926)

Gross earnings from operation:		
Electric light and power	$16,467,204	
Electric and steam railroads	5,971,273	
City railway and bus lines	4,198,798	
Gas	3,336,916	
Heat	712,847	
Bridge	618,037	
Ice	261,304	
Water	110,476	
Miscellaneous	213	
Combined gross earnings	$31,677,074	
Less intercompany items	487,445	
Gross earnings from operation		$31,189,628
Expenses and taxes:		
Operating expenses (less intercompany $487,445.07)	$14,334,148	
Maintenance	3,772,226	
Taxes, local and federal	1,274,614	
Total expenses, maintenance and taxes		19,380,989
(Labor, fuel and other costs of producing and distributing utility service. Expenditures for repairs to keep the property in good operating condition. Estimated federal, state and local taxes.)		
Net earnings from operation		$11,808,639
(Balance remaining to pay interest on bonds and other current borrowings, dividends and to provide for depreciation.)		
Less fixed charges:		
Interest charges, etc	$5,850,033	
Bond discount amortized	262,641	6,112,675
Surplus available for dividends and depreciation		$5,695,964
Dividend on Preferred Stocks:		
Illinois Power & Light Corporation and subsidiary companies		2,590,883
		$3,105,081
Appropriated for depreciation, retirements, replacements, etc		1,721,892
(Amount appropriated from current earnings to provide for retiring, renewing or replacing physical property.)		
Balance		$1,383,189
Surplus Jan. 1, 1926		1,508,040
		$2,891,229
Dividends paid on common stock, 1926		900,000
Surplus per balance sheet		$1,991,229
(Surplus earnings reinvested in physical property or reflected in current assets, etc.)		

Toledo Losing Money—Little Variation in Passenger Traffic

Suggestion that the Community Traction Company, Toledo, Ohio, is losing money, patronage and good will by the dilatory methods of working out some agreeable solution to its transit problems, which will secure extensions of service, put streets in good conditions, secure better service at more reasonable fare and also enable the company to improve its equipment, is contained in the annual report made by acting Street Railway Commissioner E. L. Graumlich to the City Council.

INCOME STATEMENT OF THE COMMUNITY TRACTION COMPANY, FOR YEAR ENDED DEC. 31

	1926	1925
Passenger revenue	$3,404,105	$3,483,896
Special car revenues, express revenue, non-operating revenue, etc	156,417	149,039
Total revenue from all sources	$3,560,522	$3,632,935
Total operating expenses including taxes	$2,866,178	$2,794,724
Net income from operation	$694,344	$838,210
Depreciation	137,906	138,091
Sinking fund—City's purchase fund	299,899	284,149
Interest on floating debt	12,831	10,238
Total deductions from income	$450,637	$432,479
Balance is amount available for the stabilizing fund	$243,706	$405,731
Interest on bonds	409,955	426,260
Dividends preferred stock	87,704	86,562
Total interest and dividends	$497,659	$512,822
Net deficit	$253,952	$107,090

Total revenue of the company for 1926 was $3,560,522, compared with a gross revenue of $3,632,935 for the previous year. There was less than 1 per cent loss in passenger revenue, but a decrease in the income from rentals received from interurban lines for use of city tracks made up a large part of the difference in revenues. However, operating costs, taxes and other expenses increased, which for the year's operation produced a loss of $253,952, compared with $107,090 in 1925, after the required set-up for various reserves and charge was made for interest on bonds and dividends on preferred stock.

In explaining how the company can continue to operate on such a losing basis Commissioner Graumlich says the sinking fund credits should be taken into consideration as offsetting in a measure the deficit accumulated in the

Total—1925..................................	6,737,633	521,499

stabilizing fund. Total loss as reflected in the stabilizing fund was $910,544 at the close of 1926. This covers the entire six years of service-at-cost operation under the Milner ordinance. However, during this period the sinking fund accounted for retirement of $1,406,000 of the bonds with some additional cash balance in the fund.

Deficit is adjusted...............	$23,177	6.842
Ratio expense (as adjusted) and taxes to total revenue, per cent.........		128.223

Commissioner Graumlich said in his report:

> The result of the operation under the ordinance, however, is not equally satisfactory to the car riders nor to the citizens of the city generally. The loss in revenue due to competitive bus service and the high operating costs resulting from duplicated car service and excessive power charges, together with the heavy requirements for the sinking fund, have not left sufficient money available for the required maintenance and renewal of the company's property even at a maximum rate of fare and with curtailed service.
>
> This is not only reflected in the inability of the company to render satisfactory service but it also seriously interferes with the city's public improvement program, since new track construction cannot be financed and consequently new pavements on important thoroughfares are being held up or can only be partially completed.
>
> The operation of the company has not only been handicapped, as stated, but during the past year franchise negotiations which have been continuously under way have seriously interfered with the management of the system.

Commissioner Graumlich points out that under such unsettled conditions it has been impossible to take advantage of the aggressive policies being developed by street railways in other cities for winning business. It is estimated that independent buses cause a loss of about $250,000 in revenue annually to the street railway property. Through special investigation and a more careful inspection system, pull-ins were reduced 40 per cent. The company spent $82,501 in paving between tracks and laid the equivalent of a street 36 ft. wide and 3 miles long in new and relaid brick paving.

Net Income in London, Ont., Increases

The gross earnings of the London Street Railway, London, Ont., for the year ended Dec. 31, 1926, was $626,690, a decrease of $2,202 compared with 1925. Operating expenses were $528,528, a decrease of $482 as compared with 1925. The expense of allocation was as follows: Maintenance and structure, $70,335; equipment, $54,180; power, $45,022; operation of car, $258,564; operation of buses, $44,750, and miscellaneous, $55,676. The net income after deductions for fixed charges, depreciation and Dominion income tax, amounted to $14,958, showing an increase over 1925 of $107. These facts were disclosed in the 52d annual report, submitted at the annual meeting held in February.

Continuing the policy of making improvements to the property, the company reconstructed approximately 75 per cent. of the double trackage and new special work was accomplished. Improvements covering road and equipment for the year amounted to $27,291. In addition to these improvements, the company purchased during the year, six Yellow Cab buses at a total cost of $46,160. The total improvement for the year amounted to $73,451.

The report refers to the 5-cent fare agreement renewed during the year and to the negotiations carried on with the City Council for an extension of the franchise and the purchase of the railway, both of which propositions were defeated at the municipal elections held on Dec. 6, 1926.

Included in the annual report are a seven years comparative statement of revenue and expenses under old fares (except temporary increase — five months in 1919) and a five-year comparative statement of revenues and expenses under 5-cent fare, June 14, 1922, to Dec. 31, 1926. The latter statement is reproduced in this digest.

May Abandon One Line.—Abandonment of the Detroit, Lake Shore & Mount Clemens line of the Detroit United Railway, Detroit, Mich., operating between Detroit and Mount Clemens, is possible in the near future. In this connection St. Clair Shores village gave notice more than a month ago that the franchise in that village granted in 1897 and expiring June 21 would not be renewed. The line's franchise in Grosse Point Village and Grosse Point Farms has seven years more to run. The line, unprofitable for a number of years, was built as a rival to the Rapid Railway system operating between Detroit and Mount Clemens and which also was absorbed by the Detroit United Railway.

FIVE YEARS COMPARATIVE STATEMENT OF REVENUES AND EXPENSES OF THE LONDON STREET RAILWAY

Under 5-Cent Fare—June 14, 1922, to Dec. 31, 1926

Personal Items

H. B. Cobban Heads Midwest Association

Operating Head of Oklahoma Road Elected at Recent Meeting of Railway Men in St. Louis

H. B. Cobban, Miami, Okla., secretary-treasurer and general manager of the Northeast Oklahoma Railroad, was elected president of the Midwest Electric Railway Association at the meeting held in the Hotel Chase, St. Louis, Mo., June 9, 10 and 11. The association is composed of officials and employees of electric railways in six states, Missouri, Kansas, Oklahoma, Arkansas, Nebraska and Colorado. Incidentally it might be said that Oklahoma is in line for the June meeting in 1928, as an invitation has been extended to the association to meet in Miami, the home of the new president-elect.

H. B. Cobban

Mr. Cobban has been secretary-treasurer and general manager of the Northeast Oklahoma Railroad since Dec. 1, 1919. This represented his entrance into the railway field, for before that he had been engaged in manufacturing and in jobbing. He was born in Wakeman, Ohio, on Aug. 3, 1877, and attended the grade schools in Springfield, Mo. He is a man of many interests, linked not only with the agricultural Middle West but with its mining activities and its banking and general business. He is president of the Miami Building and Loan Association, a director of the Miami Chamber of Commerce, a director of the Oklahoma Utilities Association, chairman of the industrial committee of the Miami Chamber of Commerce and president of the Miami Rotary Club. In the past he has been vice-president of the Oklahoma Utilities Association, secretary of the Miami Chamber of Commerce, president of the Miami Chamber of Commerce, a member of the Oklahoma Council of Defense, vice-chairman of all Liberty Loan drives, secretary of the Miami Building and Loan Association, vice-president of the Ottawa County Chapter of the American Red Cross, and chairman of the United States Boys Working Reserve.

Henry S. Day Goes to Providence

Henry S. Day has been appointed superintendent of equipment of the United Electric Railways, Providence, R. I. He assumed his new duties on June 16. Mr. Day has had 25 years experience in contact with direct maintenance of electric railway equipment.

He started his career with the Westinghouse Electric & Manufacturing Company as a road engineer, specializing on railway equipment in the New York territory. For five years he was in charge of maintenance and inspection of electric motive power for the New Haven road. Valuation and appraisal of electric railway properties engrossed his attention for three years when he was connected with Sanderson & Porter of New York. After duty overseas in the World War, in which he served as captain of engineers, Mr. Day returned to this country and took a position with the Kansas City Railways, Kansas City, Mo., as equipment engineer in charge of the mechanical department. In this capacity he succeeded in reducing the expenses of the department to the extent of several hundred thousand dollars a year. During the past three years he has been manager of the transportation division of the Westinghouse company.

Changes in Philadelphia Personnel Approved

The resignation of W. K. Myers as president of the Philadelphia Rapid Transit Company, effective on July 1, was submitted to the board of directors at its regular monthly meeting on June 20 and accepted by that body. Mr. Myers is relinquishing active control of the Philadelphia Rapid Transit Company to assume the duties of executive vice-president of the recently organized Mitten Bank Securities Corporation. He will continue a member of the executive committee and of the board of directors of the railway.

R. T. Senter, at present vice-president of the Philadelphia Rapid Transit Company, was elected president to succeed Mr. Myers.

In his letter of resignation to T. E. Mitten, chairman of the board of directors of the Philadelphia Rapid Transit Company, Mr. Myers said:

> At the request of the board of directors of the Mitten Bank Securities Corporation, I have accepted the position of executive vice-president of that organization.
>
> As the duties of this office will require all of my attention, I will be unable to continue as president of the Philadelphia Rapid Transit Company. I therefore submit my resignation as president of this company, effective July 1, 1927.

This formal action represents the consummation of a plan to which extended reference was made in the Journal for June 11, 1927, page 1067.

J. R. Fitzpatrick Vice-President of Haskelite

James R. Fitzpatrick has been made vice-president of the Haskelite Manufacturing Corporation, Chicago, Ill. Mr. Fitzpatrick continues as secretary and member of the board of directors. He also continues in charge of sales.

Briefly, he has been with the Haskelite Manufacturing Corporation almost since the organization of the company in 1917, and has served it in all capacities from factory manager to purchasing agent and sales manager and also as an executive.

Mr. Fitzpatrick is very active in trade associations in the electric railway field. At the present time he is a member of the American Electric Railway Association special manufacturers' committee and a member of the committee on meetings and subjects. He served on the American Electric Railway Association exhibit committee in 1925. He is a member of the American Society of Civil Engineers and the Society of Automotive Engineers.

J. R. Fitzpatrick

Mr. Fitzpatrick was graduated from the Rensselaer Polytechnic Institute of Troy, New York, with the degree of civil engineer. Some time ago he was elected trustee of this institution.

J. T. Foster Purchasing Assistant to New Jersey Vice-President

Joseph T. Foster has been appointed purchasing assistant to the vice-president of the Public Service Corporation of New Jersey, Newark, parent company for the Public Service Railway and the Public Service Transportation Company, in charge of real estate and purchases. He has been in the employ of Public Service since 1914, the year in which he was graduated from Columbia University. He started in the testing laboratory of Public Service Electric Company and a year later was transferred to the engineering department of that company. In 1917 he was made an assistant engineer and in 1922 was promoted to assistant to the vice-president and general manager of Public Service Production Company. Two years later he was made assistant to the chief engineer of that company, the position he held just prior to his recent promotion.

G. H. Kelsay has resigned as electrical engineer of the Cleveland Southwestern Railway & Light Company, Cleveland, Ohio, and has accepted a position as assistant to the president in charge of the Montpelier Foundry & Machine Company, Montpelier, Ind. He was with the property at Cleveland for eight years, a greater portion of the time in charge of substations, car maintenance and maintenance of overhead lines. He engineered and supervised the installation of the 60-cycle railway substation equipment, installing automatic substations and semi-automatic stations at a substantial saving in the power distribution and substation operation on the Cleveland Southwestern Railway. Previous to his connection with the latter company he was superintendent of power in charge of power plants, substations and distribution lines for the Union Traction Company of Anderson, Indiana. This work covered a period of fourteen years.

Judge James H. Reed Dead

Jurist Was Long an Officer of the Philadelphia Company and the Pittsburgh Railways—Notable Record in Realm of Corporation's Legal and Financial Activities

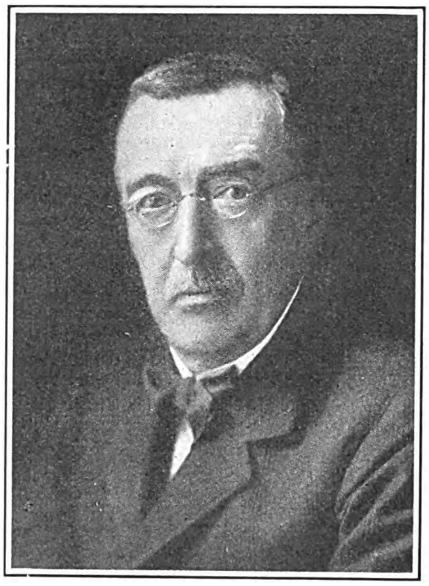
JAMES H. REED, senior vice-president and a director of the Philadelphia Company, Pittsburgh, senior vice-president and a director of the Pittsburgh Railways and an officer of many other corporations, died on June 17 after an illness of about two weeks. Judge Reed, although nearly 74 years of age, had never retired. He was at his offices daily attending to his manifold duties until two weeks before his death, which was due to a complication of ailments. At times in the course of his illness Judge Reed rallied and hopes were entertained for his recovery, but on June 15 it became apparent that the end was drawing near.

For nearly half a century Judge Reed had been one of the leading attorneys of the country. He was a leader in finance and industry, who, while active in law practice all his life, organized and aided in directing many of the greatest corporations in the United States. He was deeply interested in many philanthropic and educational activities and gave unsparingly of his time and effort in their organization and administration. He was the founder and president of the Pittsburgh Skin & Cancer Foundation and a director of the Western Pennsylvania Hospital. He was treasurer and a member of the board of trustees of the Carnegie Institute, Carnegie Institute of Technology, Carnegie Library and the Carnegie Hero Fund Commission, also vice-president and director of the United States Steel Pension Fund.

Judge Reed in 1899 prepared the charter and other preliminaries to the organization of the Consolidated Gas Company of Pittsburgh, and after this and other companies had been acquired by the Philadelphia Company he became president of the consolidated interests. He retired as president in 1919, but continued his connection with these enterprises as senior vice-president and director.

When Andrew Carnegie was approached concerning the sale of his steel company and allied possessions to the United States Steel Corporation, Judge Reed was delegated to attend to the various legal and other technicalities incident to this transaction. When the sale eventually was consummated Judge Reed became a member of the directorate of this noted organization.

An idea of the variety and extent of his associations and activities may be obtained in reading the list of some of his connections: Senior member of the law firm of Reed, Smith, Shaw & McClay, president and director of Pittsburgh, Bessemer & Lake Erie Railroad, president and director of the Union Railroad, chairman of the board of Farmers Deposit National Bank, director of Farmers Deposit Savings Bank, director of Farmers Deposit Trust Company, director of Fidelity Title & Trust Company, director of Gulf Oil Corporation, vice-president and director of Philadelphia Company and its associated companies, president and director of Reliance Life Insurance Company of Pittsburgh.



J. H. Reed

Judge Reed's elementary education was obtained in the public schools of his native city and was supplemented by study in the old Western University of Pennsylvania (now the University of Pittsburgh), from which he was graduated in 1872. He began the study of law in the office of his uncle, David Reed, at that time a foremost Pittsburgh and Pennsylvania lawyer. He was admitted to the Allegheny County bar in 1875, and soon afterward the firm of Knox & Reed was formed, the senior member being Philander Chase Knox, afterward Attorney-General of the United States and Secretary of State, closing his career as United States Senator from Pennsylvania.

This firm was successful from its start, both attorneys being corporation lawyers, with many of the largest manufacturing and commercial concerns in the city as clients. Later, when Marcus W. Acheson, judge of the United States District Court for the Western District of Pennsylvania, was elevated to the Circuit bench, Mr. Reed was nominated to the District Court vacancy, which he accepted with great reluctance. Due to this disinclination for judicial work, Judge Reed resigned within a year, and the firm of Knox & Reed resumed its activities. This firm was finally dissolved when Mr. Knox became Attorney-General under President McKinley, and the firm of Reed, Smith, Shaw & Beal, now Reed, Smith, Shaw & McClay, was formed by the remaining partners.

Judge Reed was for many years general counsel and vice-president of the Pittsburgh & Lake Erie Railroad Company, one of the most important parts of the New York Central system. Later he became general counsel for the Carnegie Steel Company, having been counsel for many of the constituents of this corporation for years before their general merging. He outlined the basis for the organization of the Pittsburgh, Bessemer & Lake Erie Railroad Company and had been its president from its formation.

Judge Reed was born on the north side of Pittsburgh on Sept. 10, 1853, son of the late Dr. Joseph Allison and Eliza (Hay) Reed.

Samuel G. Boyle

Samuel G. Boyle, for 28 years secretary-treasurer of the Louisville Railway, Louisville, Ky., and the oldest active officer of the corporation, died on June 11 at his home in Louisville. Mr. Boyle went to Louisville in 1900 as secretary-treasurer of the Louisville Railway, an outgrowth of the first railway in Louisville, founded by his father, General Boyle, and known as the Portland Avenue line. At that time Louisville was a big river handler, and there was need of a line connecting Portland and Louisville. Samuel Boyle, the son, was born at Danville, Ky., in 1860. He attended Centre College at Danville, Ky., and Johns Hopkins University. Later he edited and published the *Kentucky Stock Farmer*, was editor and publisher of the Lexington *Herald* and was also an editorial writer for that paper from 1921 to 1924.

George E. Patterson, long a resident of St. Catharines, Ont., and a pioneer in street and electric railway work in Canada, died in Pasadena, Cal., on June 12. He was 88 years old. Mr. Patterson established a carriage building business in St. Catharines in 1874 and later constructed horse cars, one of which was converted into an electric car and operated between St. Catharines and Thorold in 1887. Thirty years ago he went to Philadelphia and manufactured electrical equipment until his retirement five years ago.

Manufactures and the Markets

News of and for Manufacturers—Market and Trade Conditions
A Department Open to Railways and Manufacturers
for Discussion of Manufacturing and Sales Matters

Treasury Department Drops German Rail Dumping Case

No evidence having been obtained to support a suspicion of dumping, the Treasury Department has ordered collectors of customs to release appraisement reports on steel rails imported from Germany and the investigation as to dumping has been dropped.

The investigation was ordered by the Treasury last March following a complaint from a domestic producer of steel rails that an importation of rails from Germany for the Boston & Maine Railroad was at a price below the market price in Germany and hence violative of the anti-dumping law. Investigation among other producers of steel rails in this country, however, coupled with inquiries in Germany, failed to substantiate the suspicion and the complaint was withdrawn by the company which filed it.

Large Switching Equipment Order Goes to Westinghouse

The Pennsylvania Railroad has just placed with the Westinghouse Electric & Manufacturing Company a large order for switching equipment for installation on the Philadelphia to Wilmington electrification project. The order includes 39 high-speed oil circuit breakers and their relays for the operation and protection of the 11,000-volt trolleys. Breakers are rated at 1,500 amp. and insulation is provided to permit a wet test of 112,000 volts. The combined maximum operating time of the breakers and their relays under short-circuit conditions is 0.04 second. This high-speed action is necessary to prevent interference with parallel telephone cables.

Included in the order also are seventeen 66,000-volt outdoor potential transformers, six type 331 oil circuit breakers, 50 type "SV" lightning arresters and choke coils and three large grounding resistors.

Centenary Celebrated by Dixon Crucible Company

By means of a handsomely finished brochure prepared by Floyd W. Parsons, author of "American Business Methods," etc., the Joseph Dixon Crucible Company, Jersey City, N. J., is celebrating its hundreth year of business life.

Mr. Parsons' story, entitled "A Tale of Yesterday, Today and Tomorrow," has a distinct literary style skillfully employed to dignify one of America's oldest business concerns. After painting the prejudices and trials which Joseph Dixon faced in creating his business, Mr. Parsons recounts the steady and consistent strides of the company from the time Dixon's attention was called in 1827 to the discovery of graphite on a New Hampshire farm.

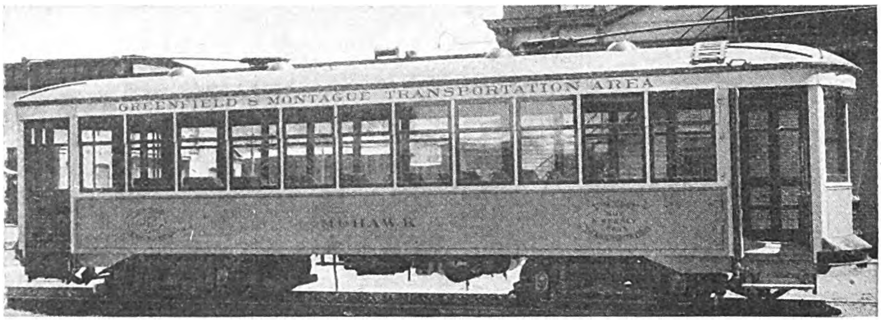
In paying tribute to the founder, this keen critic of American business methods writes: "It requires a peculiar type of mind and character to establish a business that will live and grow throughout a century. A study of American industry clearly discloses that the founders and builders of our oldest commercial institutions had certain characteristics in common. First was the urge to pioneer. Some satisfied this spirit by staying home and digging deep the foundations for an enduring trade structure. . . . The chief equipment of the scientist of yesterday was nothing more than inquisitive persevering minds. . . . Joseph Dixon was of that school, his was the restless, questioning brain!

S. H. Blake Chairman of G. E. Standardization Committee

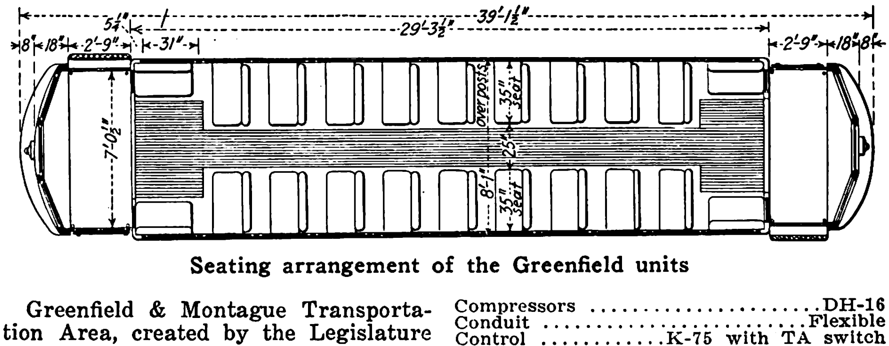
A. H. Moore, after 39 years of faithful and effective service with the General Electric Company and its associated foreign manufacturing companies, will retire on Aug. 1, 1927, on account of ill health.

S. H. Blake will succeed Mr. Moore as chairman of general and other standardizing committees and will take over his duties as of June 1, 1927.

Two New Interurban Units for Greenfield-Montague Area



Two of these trim interurban cars were added to the equipment of the Greenfield & Montague Transportation Area last month. They have a seating capacity of 32 passengers each



Seating arrangement of the Greenfield units

Greenfield & Montague Transportation Area, created by the Legislature to provide for the operation of the electric interurban line connecting Greenfield, Turners Falls and Montague, Mass., under municipal auspices, accepted delivery in May of two one-man, two-man, semi-steel interurban cars constructed by the Wason Manufacturing Company, Springfield, Mass. Specifications follow:

Date of order	Dec. 12, 1926
Date of delivery	April 30
Number of units	2
Type of unit	One-man, two-man, motor, passenger, interurban, double-end, double-truck
Number of seats	22
Length over all	39 ft.
Length over body posts	29 ft. $3\frac{1}{2}$ in.
Truck wheelbase	5 ft. 4 in.
Width over all	8 ft. $2\frac{11}{16}$ in.
Height, rail to trolley base	10 ft. $10\frac{3}{8}$ in.
Window post spacing	31 in.
Body	Semi-steel
Roof	Arch
Doors	End
Air brakes	Westinghouse
Armature bearings	Plain
Axles	Brill
Car signal system	Faraday high voltage
Compressors	DH-16
Conduit	Flexible
Control	K-75 with TA switch
Couplers	$1\frac{1}{4}$-in. drawbar
Curtain fixtures	Curtain Supply Co.
Curtain material	Fabrikoid K-2 color 86
Destination signs	Hunter 128 R.R.
Doors	Folding
Floor covering	Goodrich rubber
Gears and pinions	Westinghouse helical
Glass	DTA
Hand brakes	Peacock type A-14-34
Heaters	Gold Car Heating & Lighting Co.
Headlights	Crouse-Hinds portable
Headlining	Agasote
Interior trim	Mahogany
Journal bearings	Plain
Journal boxes	Brill $3\frac{1}{4}$ x 6 in.
Motors	Westinghouse 510-E No. 4, inside hung
Roof type	Arch
Roof material	Cotton duck
Sash fixtures	J. L. Howard
Seats	Brill 201-B
Seat spacing	31 in.
Seating material	Genuine Spanish grain leather
Steps	Folding
Step treads	Kass
Trolley catchers	Ohio Brass
Trolley base	U. S. 20-A
Trucks	Brill 177-E-1
Ventilators	Brill exhaust
Wheels, type	Rolled steel diameter 27 in.
Wheelguards or fenders	Wood

Trend and Status of Adopted and Eliminated Varieties of Paving Brick

Considering the varieties adopted as recognized by the permanent committee on March 20, 1925, and again on April 1, 1926, it is noted that in 1914 these four varieties constituted 53 per cent of the total shipments of paving brick, and with minor fluctuations have shown a constant gain until in 1924 they constituted 82.1 per cent of the total shipments of the industry. Shipments in 1925 in these four recognized varieties show a falling off to 74.2 per cent of the total and to 65 per cent in 1926, due primarily to the decrease in shipments in the 4-in. depth brick. The decrease in shipments of the thicker brick, accompanied by a more marked increase in shipments of the thinner brick, stands out prominently in the trend of shipments in 1926.

The one variety (3x3½x8½-in. Dunn wire-cut lug brick) eliminated on March 20, 1925, has never amounted to a big percentage of the shipments. It was first listed in 1916. Shipments of this variety during 1926 amounted to 2.8 per cent of the total shipments.

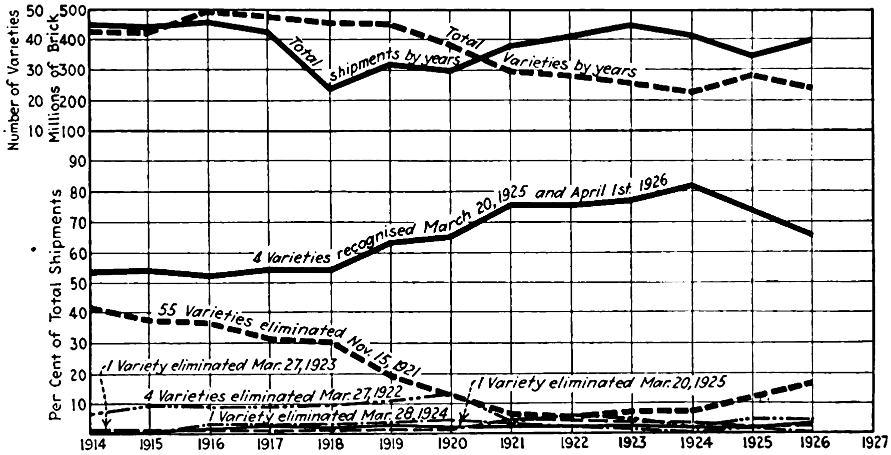


Chart of paving brick eliminated and recognized, 1914-1926

The one variety (3½x3½x8½-in. Dunn wire-cut lug brick) eliminated on March 28, 1924, has likewise never amounted to a big percentage of the shipments. It also was first listed in 1916, with 2.5 per cent. Since that year shipments have declined until in 1926 no brick of this variety were shipped.

The one variety eliminated on March 28, 1923 (4x3½x8½-in. repressed hillside brick), reached its maximum in 1921, when shipments of this variety constituted 4.8 per cent of the total for that year. It has fallen off steadily from that time, being only 2.2 per cent of the total shipments for the year 1926.

The four varieties eliminated on March 27, 1922, constituted in 1914 only 6 per cent of the total shipments of paving brick. The increase in shipments of these varieties was steady until 1920, when it reached the maximum of 15.7 per cent. Since 1921 shipments of these varieties have decreased to a total of only 4 per cent in 1926.

The 55 varieties eliminated on Nov. 15, 1921, constituted in 1914 40.9 per cent of the total shipments. The decline in shipments of these varieties was steady from 1918 to 1922 inclusive, when they constituted 5.2 per cent of the total shipments. Due primarily to the increased shipments of the 2½x4x8½-in. plain wire-cut brick, the percentage of these shipments has risen steadily since 1922, until in 1926 the total amounted to 16 per cent of those of the industry.

European Engineers Interested in Lincoln Arc Welding Prize

Mechanical engineers the engineering world over are expressing keen interest in the announcement made in New York recently by the American. Society of Mechanical Engineers that they had accepted the custody of $17,500 in prize money to be given to the writers of the three best papers disclosing new information that will tend to advance the art of arc welding.

Any one in any part of the world may compete for this prize, which is being given by the Lincoln Electric Company, Cleveland, Ohio. Entrants must submit their papers in duplicate and in accordance with the rules of the competition by Jan. 1, 1928, to Calvin W. Rice, secretary of the American Society of Mechanical Engineers, 29 West 39th Street, New York City. The first prize is $10,000, the second $5,000 and the third $2,500. Mr. Rice will furnish other details if desired.

3,634 Sq. Ft. a Day

was the A.E.R.A. Exhibit Committee's average for 29 working days. Which means that at the close of business on June 18

105,402 Sq.Ft.

had been sold to

223 Applicants

This beats last year's score for the same period by 32 applicants and 3,956 sq.ft.

IT WON'T BE TOO LATE UNTIL OCT. 3

Eight One-Man Cars Ordered by Beaver Valley Traction

The Beaver Valley Traction Company, New Brighton, Pa., announces that eight one-man, city type, double-truck cars are now being constructed in the plant of the Osgood-Bradley Car Company at Worcester, Mass., on which delivery is expected in the early fall. The order, previously announced in the JOURNAL of March 12 as embracing only six units, was placed May 10. It followed the rehabilitation of ten of twenty recently purchased cars that were found not to conform with the standard of ease and refinement set by the company for its patrons.

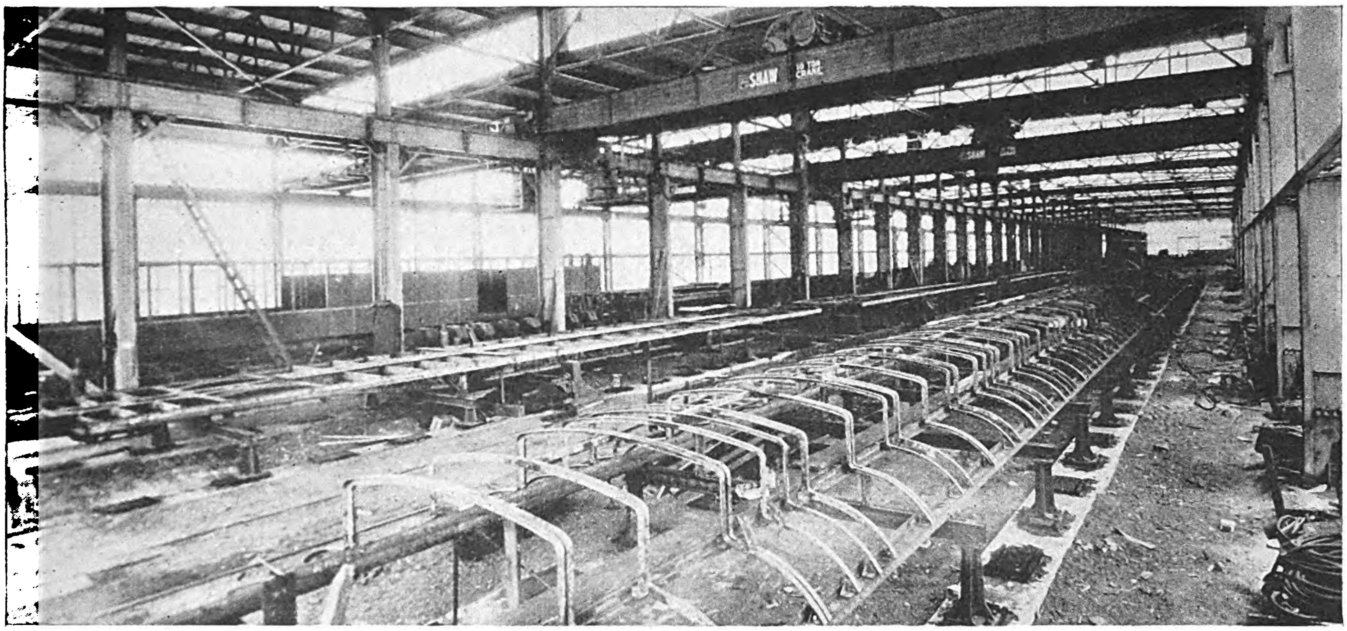
The car bodies will be semi-steel, 44 ft. over all and seating 52 passengers. Westinghouse 510-E motors have been specified. Doors will be located on the right side only.

Clinton D. Smith, general manager, has released the subjoined specifications and plans and photographs will be published in a latter issue of the JOURNAL.

Number of units	Eight
Type of unit	one-man, motor, passenger, city, double-end, double-truck
Number of seats	52
Builder of car body	Osgood-Bradley
City and state	Worcester, Mass.
Date of order	May 10
Date of delivery	Oct. 30
Weights:	
Car body	20,000 lb.
Trucks	9,600 lb.
Equipment	5,970 lb.
Total	35,570 lb.
Bolster centers	20 ft. 0 in.
Length over all	44 ft. 0 in.
Length over body posts	30 in.
Truck wheelbase	5 ft. 6 in.
Width over all	8 ft. 6 in.
Height, rail to trolley base	11 ft. 1½ in.
Window post spacing	28½ in.
Body	Semi-steel
Roof	Arch
Doors, right side only	End
Air brake	Westinghouse Traction Brake Co.
Armature bearings	Plain
Axles	Standard Steel Car
Car signal system	Consolidated
Compressors	Westinghouse DH-16
Conduit	Flexible
Control	K-35
Curtain fixtures	Curtain Supply Company
Curtain material	Curtain Supply Company
Destination signs	Hunter
Door mechanism	National Pneumatic
Doors	Folding
Fare boxes	Cleveland
Finish	Paint
Floor covering	Battleship linoleum
Gears and pinions	Helical
Glass	Crystal sheet
Hand brakes	Peacock
Heaters	Consolidated
Headlights	Golden Glow
Headlining	Agasote
Interior trim	Mahogany
Journal bearings	Plain
Journal boxes	Standard Steel Car Co.
Lamp fixtures	30-volt lamp dome feature
Motors	Westinghouse 510-E, inside hung
Painting scheme	Body orange-sash
Roof	Arch
Roof material	Canvas
Safety car devices	Westinghouse
Sash fixtures	Edwards
Seats	Hale & Kilburn
Seat spacing	28½ in.
Seating material	Leather
Slack adjusters	Westinghouse
Steps	Folding
Step treads	Kass
Trolley catchers	Ideal
Trolley base	Nuttall No. 14
Trolley wheels	More-Jones
Trucks	Standard Steel Car Co.
Ventilators	Nichols-Lintern
Wheels	Rolled steel, diameter 28 in.
Wheelguards	H B lifeguards

More Cars for Sheffield, England

The total number of 50 new double-deck cars built under contract for the Sheffield Corporation have now been delivered. The Council's capital estimates for 1927-28 include £117,000 for



St. Louis Car Company is greatly increasing its car capacity by the opening of this modern steel erecting shop. The new structure is 1,000x135 ft. An L-shaped section at the lower end of the building will house raw materials

50 more double-deck cars, half of them to be bought under contract and the other half to be built in the corporation's shops.

$100,000 Car Modernizing Program for Virginia Company

The Virginia Electric & Power Company will spend about $100,000 in modernizing sixteen of its double-truck street cars in service at Norfolk, Va., according to latest reports. The cars will be changed from the two-man type to the one-man type. Work will be done at the Norfolk shops of the company. In many respects the rebuilt equipment will resemble the new units recently placed in service on the Naval Base line. They will have leather-upholstered seats, front and rear exits and an automatic air brake control system.

Canadian Bridge Approach to Be Improved

Anticipating heavy travel over the Falls View Bridge, the International Railway, its owner, recently announced that improvements to the Canadian bridgehead will be begun immediately after approval of plans now being prepared by Findlay & Foulis of Niagara Falls, Ont. The plans are in accordance with an outline discussed by B. J. Yungbluth, president of the railway, with prominent business men, newspaper publishers, city and park officials from both sides of the river early this year.

Work on improvements of the American end of the bridge, providing a maximum of eight inspection lanes instead of two, with greatly increased parking space and diversion of the electric railway tracks from the motor traffic lane, is now under way. Improvement of the Canadian end will involve demolition of the present buildings and construction of new buildings, harmonizing with the surroundings, and a widening of the bridge approach.

St. Louis Car Company Opens New Steel Erecting Shop

To increase its electric railway equipment capacity and to facilitate the building of steel coaches for steam railroads the St. Louis Car Company is just completing a new steel fabricating and erection shop of the most modern type. This shop is 1,000 ft. long and 135 ft. wide, built in two bays with two 10-ton traveling cranes in each bay. The shop is particularly well lighted, as the construction is of steel, erected on a low concrete foundation. The sides and roof bays are glazed with fenestra steel sash, as shown in the illustration.

Raw material, such as steel plates and shapes, are protected from the weather in a completely inclosed building, constructed for the purpose, forming an L at the lower end of the shop, and this building is also equipped with an overhead crane and runway for the expeditious handling of materials.

Shears, presses and punches are at the lower end of the shop where the material is prepared for fabrication. Four tracks built on steel jigs and concrete bases on which the cars are erected are outstanding features of the new shop. They will be perfectly aligned and surfaced for accurate construction. Facilities are such that either freight cars or passenger equipment can be efficiently produced.

When these cars are turned out at the upper end of the building they are ready for the finishing and paint shops. Additional capacity for finishing results from the new shop, as the former steel car department building No. 3 hereafter will be utilized for that purpose.

Non-Union Production Will Supply Demands for Coal

A seasonal slowing up of industrial activity is shown in the April coal consumption tonnage. The total consumption of bituminous and anthracite coal in the United States and Canada was 38,600,000 tons as of May 1. The average daily consumption amounted to 1,286,666 tons. Business in general shows a gradual seasonal curtailment; no marked recessions are in evidence.

The National Association of Purchasing Agents' coal survey gives a total of 72,288,000 tons as the amount on hand as of May 1, an average day's supply for all industries of 56 days.

The effect of the strike in union bituminous fields is clearly reflected in the production figures for April. More than 35,775,000 tons of bituminous were produced and 7,334,000 tons of anthracite, giving a total production of 43,109,000. The April bituminous figure compared with the March production of 60,147,000 at first glance might arouse some concern. However, when the present rate of consumption is taken into consideration, and the fact that industrial activity will diminish as the summer wears on, it shows clearly that the output of the non-union mines can very nearly provide for current needs.

The April production of byproduct

COMPARATIVE ESTIMATES OF U. S. PRODUCTION AND CONSUMPTION, AND STOCKS OF ANTHRACITE AND BITUMINOUS COAL IN INDUSTRIES OF THE UNITED STATES AND CANADA

	U. S. Production	Industrial Consumption	On Hand in Industries
December	66,104,000	45,085,000	49,373,000
January	63,128,000	44,671,000	55,010,000
February	58,756,000	43,536,000	57,450,000
March	64,075,000	43,237,000	65,735,000
April	43,109,000	38,600,000	77,455,000
May 1	....	....	72,288,000

coke was 3,707,000 tons, a decrease of 172,000 tons compared with the output during the preceding month. Seventy-seven active plants produced about 85 per cent of their capacity. The output of the beehive coke declined, the estimated total for the month being 780,000 tons, a decrease of 110,000 tons, or 12.4 per cent as compared with March. The output of all coke was 4,487,000 tons, of which 82.6 per cent was contributed by byproduct ovens and 17.4 per cent by beehive ovens. Production in the non-union fields has been well sustained, and if coal in storage is reasonably retained through the summer there is little reason to expect a change in the situation much before September.

The market conditions along the Atlantic Coast are dull. Considerable quantities of coal are available and some of it is being offered at a price that is not very attractive to the distributors. This is the quiet season for bituminous and, coupled with the ample stocks generally held throughout the East, practically no market stimulus exists.

On the West Coast the continued overproduction of oil has had some effect on coal consumption. Low prices on fuel oil have heightened the competitive situation.

New Home for Rockford Public Service Buses

Buses of the Rockford Public Service Company, Rockford, Ill., will be quartered in a new second-floor garage to be built by the company at its carhouse at Kishwaukee Street and First Avenue. Construction work will start as soon as bids are received and formal award made this month. The building is 200 x 98 ft. and the second floor will cover practically all this space. The enlargement will cost $50,000. A brick, fireproof structure has been specified.

Worm-Drive Axles Discussed in Timken Magazine

The May issue of *Timken Magazine*, published by the Timken Detroit Axle Company, Detroit, Mich., carries two interesting articles on the application of worm-drive axles to electric railway cars. Another article presents the Timken worm gear "driving unit." The first article explains the experimental installation made on the trucks of a car owned by the Chicago & Joliet Electric Railway, this having been treated in the JOURNAL for March 26, April 2, 16, 23 and 30 and May 7, 14 and 28. Both articles are profusely illustrated.

More Buses to Be Purchased for Cleveland

Traction Commissioner Ballou at Cleveland has announced that he will urge the City Council to approve at once the purchase of 25 new buses for the Cleveland Railway. Fifteen of the new buses would be used in rush hour service and emergencies and ten be reserved for chartering for picnics and other social outings. Mr. Ballou is quoted:

> It is imperative that these buses be purchased immediately. They are badly needed to keep the company's bus service in operation on an efficiency basis. Any argument that we should not have them because all of our bus routes are running at a loss is unsound. If we didn't have the buses we would have to lay tracks for street cars at a much higher cost.

Mr. Ballou declared that while the railway could use 50 buses he would recommend the purchase of only 25 at this time.

Metal Prices Show Little Change

The week ended June 22 has been a quiet one in the non-ferrous metal markets. Copper has sold in better volume than for two weeks, but the total business has not been large. Prices are steady. Lead has been somewhat quieter, with prices about the same as last week. Zinc has been reasonably active.

Some copper groups continue out of the market, quoting nominally 12⅜ or 12¼ cents for Eastern deliveries, but there are several sellers, and have been all week, at 12½ cents, at which price all the sales have been made so far as Connecticut buyers are concerned. Deliveries were well distributed over June, July and August, though one sale was made for as far ahead as November at 12½ cents. Wire mills have bought a little more liberally, though the wire business continues unsatisfactory, it is said.

Compared with March, the last previous 31-day month, lead production has declined nearly 11,000 tons. United States, Mexico and Spain were the largest contributors. The American Smelting & Refining Company has continued its official contract price in New York at 6.40 cents. Some small sales have been made at 6.45 cents. In St. Louis second hands sold a little lead at 6.10 cents during the early part of the market week, but sales were made at 6.125 cents and 6.15 cents each day. June 21 and 22 the prevailing price was 6.15 cents.

Prompt Straits tin has fluctuated between 67½ and 68 cents, with the price of June 22 slightly higher than that of a week ago. Spot metal is scarce both here and in London. This is reflected in the wide backwardation which amounts to about £12 in Europe. July Straits is almost 2 cents under prompt.

Practically no change has occurred in the zinc market this week. The metal has been in good demand from galvanizers and the volume of sales has been about up to the average. Most of the business has been at 6.20 cents, with scattering sales at 6.175, 6.225, and 6.25 cents. High grade is unchanged, spot carloads being offered at 8 cents, delivered in the East.

METAL, COAL AND MATERIAL PRICES
F. O. B. REFINING

Metals—New York	June 21, 1927

Rolling Stock

Butte Electric Railway, Butte, Mont., accepted delivery in May of one six-cylinder, street car type, 29-passenger Fageol bus which was shipped from the plant of the Fageol Motors Company, Oakland, Cal.

Market Street Railway, San Francisco, Cal., in April received from the Fageol Motors Company, Oakland, Cal., one six-cylinder street car type coach.

Los Angeles Railway, Los Angeles, Cal., received from the Fageol Motors Company, Oakland, Cal., eight six-cylinder, street car type coaches during March and April.

McKinley Traction System, Peoria, Ill., has put into service four new Studebaker 21-passenger buses equipped with the special Big Six engines. The exterior of each is painted in tangerine and ivory, the molding in black and the roof in maroon. The interior is finished in mahogany and the seats are upholstered with brown Spanish leather.

Track and Roadway

Carolina Light & Power Company, Raleigh, N. C., is reported by General Manager C. S. Walters as about to begin work on the College Street loop of its electric railway line, for which a franchise was voted in May.

Janesville Traction Company, Janesville, Wis., is rebuilding its tracks on South Franklin Street between Pleasant and Galena Streets. The main part of the improvement plan is the laying of concrete along the track and the welding of joints. Plans are also under way for a new track at the Academy railroad crossing and also to rebuild the track on south Main Street.

Shops and Buildings

Municipal Railway, St. Petersburg, Fla., recently opened its new carhouse, which represents an expenditure of approximately $200,000. The structure is equipped to handle all heavy car repair work and to refinish rolling stock.

Carolina Light & Power Company, Raleigh, N. C., will erect a new $175,000 carhouse at Asheville, N. C. The structure will house 50 electric cars and 50 buses on a site at Mud Cut just off French Broad Avenue.

Worcester Consolidated Street Railway, Worcester, Mass., has awarded a contract to the J. W. Bishop Company, 109 Foster Street, Worcester, for the construction of a garage on Grove Street to provide quarters for the buses, to include a repairing service. Henry R. Kent Company, Rutherford, N. J., is engineer and architect.

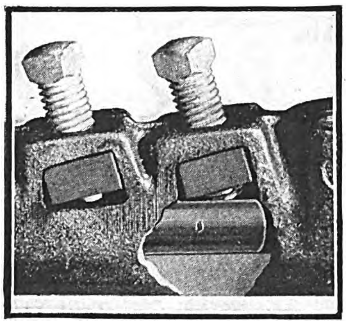
Razor Back

The RB Trolley Splicer



Keep Your
Overhead *Down*
by
Keeping it UP
with
Westinghouse
Rocking Nuts

THIS new Westinghouse splicer has an under-run shaped like a razor-back hog—hence its name, RB.

Because of its tapered shape, coming to a rounded point at the bottom, the RB splicer rides on the bottom of the groove in the trolley wheel. Wear is almost entirely confined to rolling friction. Of grinding friction where the splicer rubs against the side of the wheel there is very little on tangent track.

Burning also is reduced—by the smooth under-run that is almost as smooth as plain wire. The complete transition takes place on a straight line.

The RB splicer is easy to install. Wires are inserted without bending. A pair of pliers is sufficient to tighten the set screws with rocking nuts. And how those rocking nuts do hold! Increased tension on the wire just makes them hang on tighter.

Even Across the Seas

IN A RECENT morning's mail ELECTRIC RAILWAY JOURNAL received subscriptions from the citizens of four foreign nations. Theirs was a delicate compliment both to our contributors and the publisher. Aside from revealing a breadth of circulation, the interest of these European subscribers who buy the JOURNAL unsolicited indicates the effectiveness of its publishing policy—in short, that the subject matter of every article should contain some element of general significance, some helpful thought or suggestions by which the industry as a whole may profit.

Those who serve the public have no country. There are no barriers to the common purpose of their efforts. As public servants they must draw from every source of inspiration if their achievements are to reach the highest plane. With this spirit, therefore, the JOURNAL welcomes its new subscribers from Vienna, Leningrad, Moscow, Berlin and Bologna. May its pages afford them a stimulus for greater activity and service in their chosen field, and make them conscious that their brothers across the seas consider them as seated around a great council table.

FARADOID
High-Efficiency Pin-Type
Porcelain Insulators
Patented

Introduced—
Nine Years Ago

Today

WESTINGHOUSE ELECTRIC

The Accepted Type

ALMOST a decade ago, Westinghouse engineers departed from the then accepted types of insulators and developed a new insulator. It was based on an accepted scientific principle—the principle of the electrostatic field evolved by Faraday.

In the years that followed, minor changes were made—developing a theoretically perfect design into a workable, serviceable insulator. But the fundamental principle was not changed, and today it is recognized as the logical basis for multipart insulator design.

The Faradoid is the Westinghouse pin-type insulator whose design is based on the principle discovered by Faraday.

Porcelain
you can install
—and forget

—because science—not tradition—governs the making of **all** Westinghouse porcelain and insulators.

—precision processes, at every stage, are the rule.

—never is anything taken for granted at any time.

—even slight variations in materials are compensated for.

First the design—then the materials—then the method—and then, a vigilance that permits no compromise.

Improved O-B Trolley Wheel and Harp (Feist patents) for city service. Furnished with "U" or "V" Groove in 5 and 6-in. sizes.

Just How Costly Are Old Style Trolley Wheels?

RECENT investigations show that, including maintenance, inspections and replacements, the *average* cost for Old Style Trolley Wheels is 29.8 cents per 1,000 car miles. Some properties estimate that Old Style Trolley Wheels cost no less than 74 cents per 1000 car miles!

These figures do not include such intangible costs as, for instance, excessive wear on the overhead due to "chattering" and arcing wheels; damage to the car roof due to dripping oil; pull-ins, line breaks, and delayed schedules due to badly worn wheels.

When the *total cost per year* of Old Style Trolley Wheels is considered, is it any wonder that electric railways are welcoming the new and *Improved* O-B Trolley Wheel which costs only 19 cents average per 1,000 car miles; that needs no inspections, oiling, or maintenance from the day it is put in service; that averages 15,000 or more miles and runs as smoothly for the last thousand miles as the first, without "chattering", and with the minimum of arcing and wear on the overhead?

Electric railways that measure progress in terms of cost reduction and more efficient operation will be satisfied with nothing less than the *Improved* O-B Trolley Wheel and Harp (Feist patents) after a comparison with present trolley wheel costs and service. For an analysis of Old Style Trolley Wheel costs and complete information on the *Improved* O-B Trolley Wheel and Harp, address

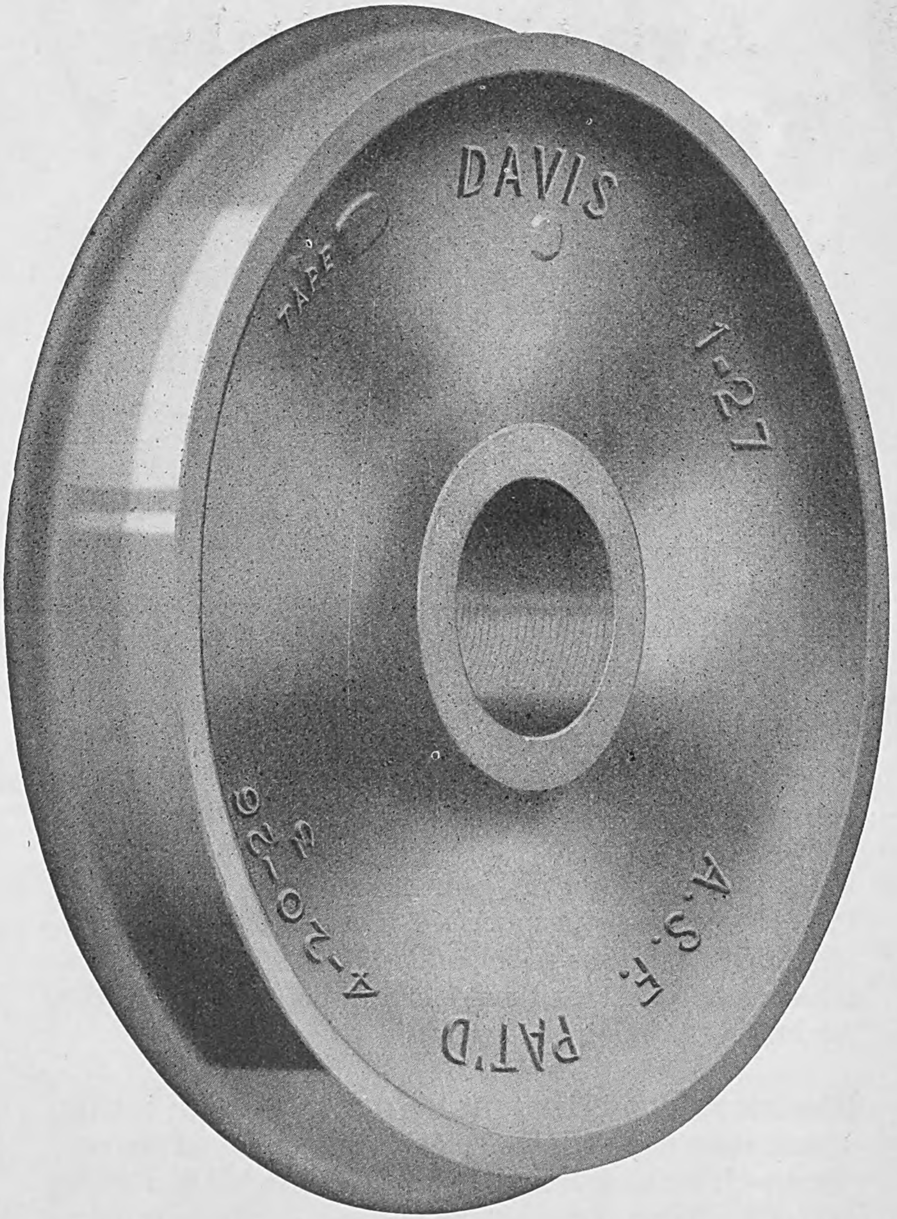
REAL WHEEL STEEL



A WHEEL can be no better than the material of which it is made.

Davis "One-Wear" Steel Wheels are made of Real Wheel Steel.

It contains elements that when heat-treated produce physical characteristics that make the "One-Wear" idea practical.

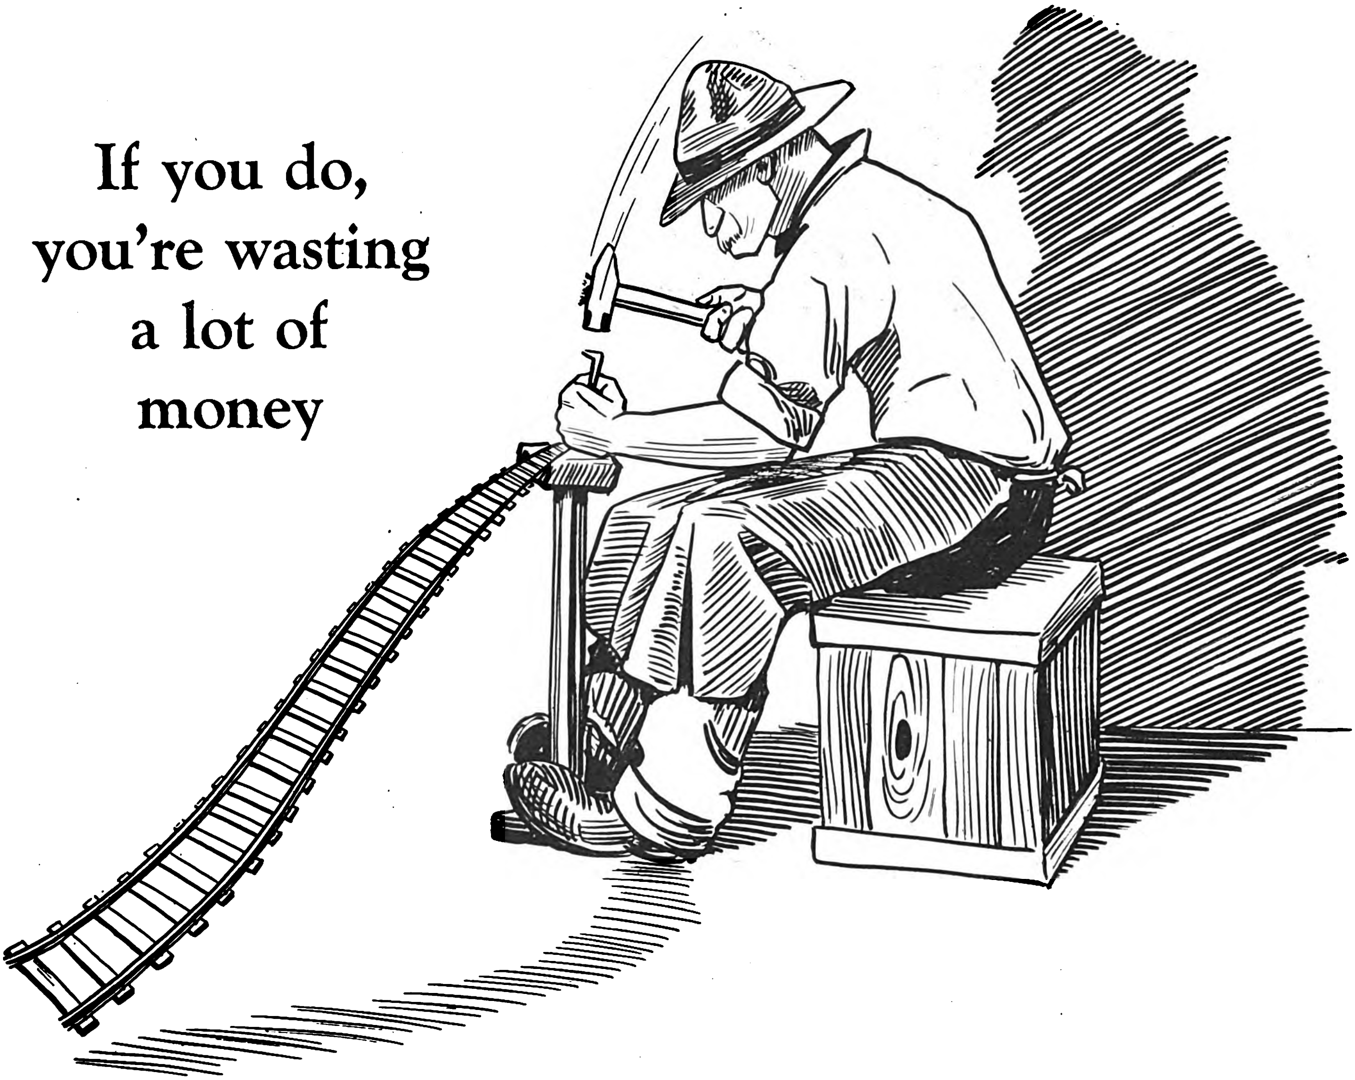
IT IS A REAL "ONE-WEAR" WHEEL METAL

AMERICAN STEEL FOUNDRIES

NEW YORK CHICAGO ST. LOUIS

Do you half-sole your track?

If you do,
you're wasting
a lot of
money



It's better to put down a foundation that will *out-wear* the rail—than to experiment with ties and foundations that break up, warping rails and demanding constant maintenance and replacement.

Steel Twin Ties, in concrete, will out-wear the rails. When the rail head wears down new rails can be laid on the old foundation. No more half-soling, you've got a permanent lasting foundation.

And the remarkable part of it all is that Twin Ties have cost less to install, and less over a period of years on hundreds of installations throughout the country.

Quick deliveries now for work that is in a hurry.

The International Steel Tie Co.
Cleveland, Ohio

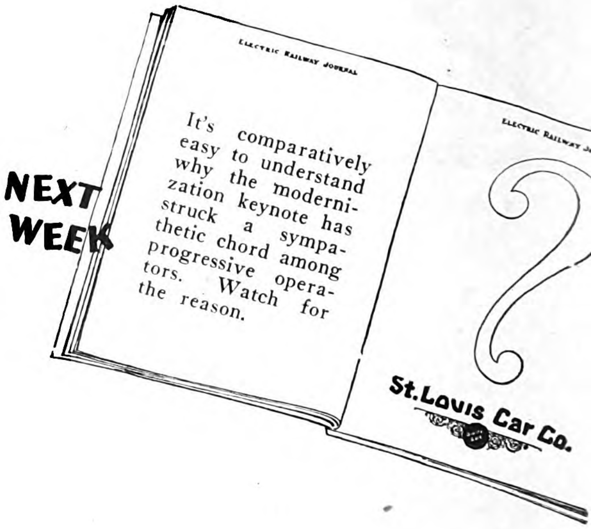
Quality Cars

In the light of PRESENT DAY knowledge and experience the advantages of the modern equipment have become obvious. Heavy, uneconomical and unattractive cars must be relegated to the scrap pile. They are mill stones that crush out profits and block progress. The only policy safe to follow today is that indicated by the cost sheets of modernized properties.

St. Louis Car Company stands ready to help you.



ELECTRIC RAILWAY JOURNAL

It's comparatively easy to understand why the modernization keynote has struck a sympathetic chord among progressive operators. Watch for the reason.

30 years ago—

An ad published almost 30 years ago in the Street Railway Review (later the Electric Railway Journal) stated rather immodestly that the Garton-Daniels Lightning Arrester was "always at the head—others follow." It is significant that after thirty years the direct current types of the Garton-Daniels Arresters remain unchanged in principle and are to-day the most widely used lightning arresters for the protection of electric railway circuits.

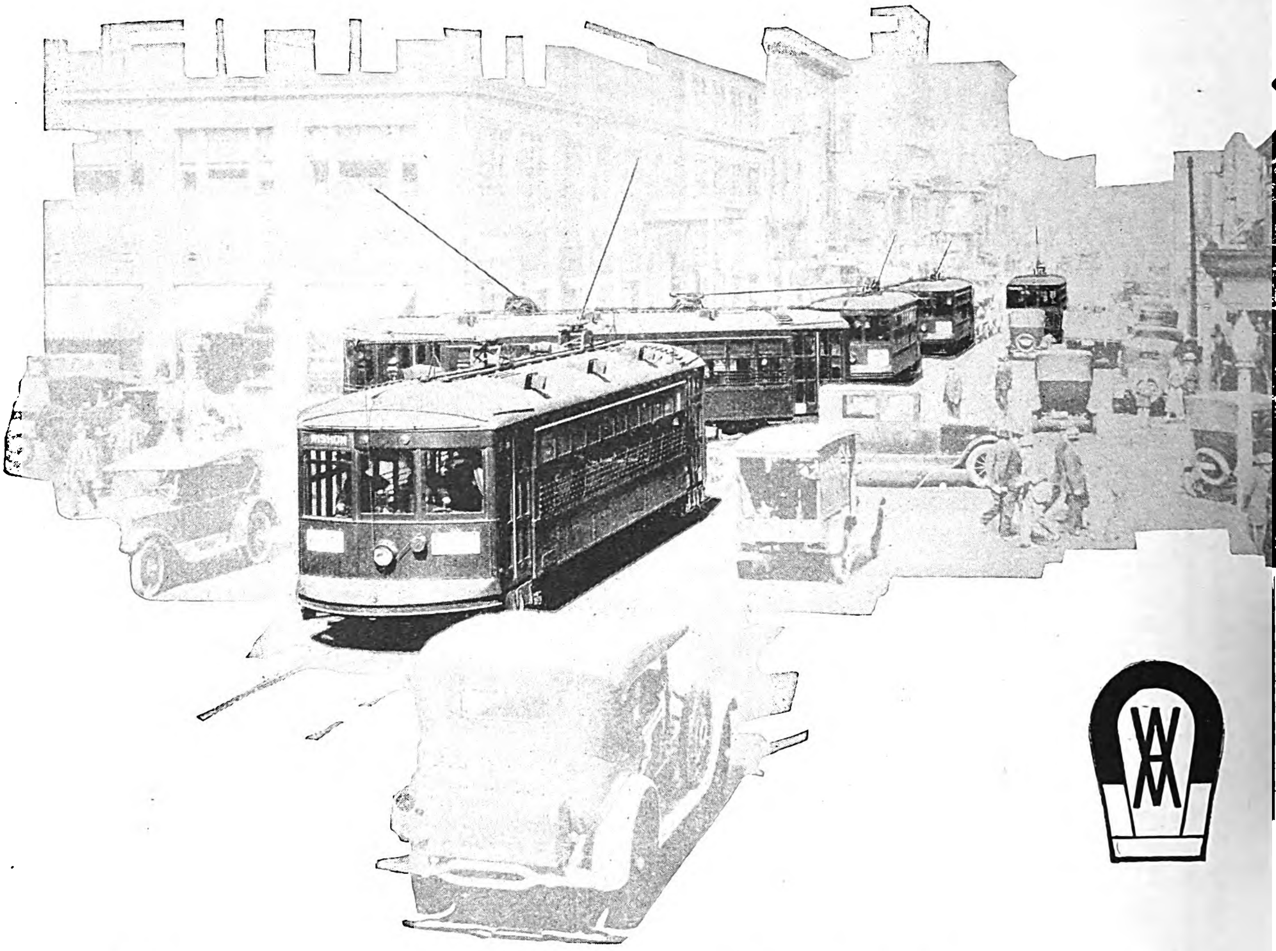
MANUFACTURER OF RAILWAY POWER AND INDUSTRIAL ELECTRICAL MATERIAL



Can your cars "hold their own"?

City streets have become so crowded that there is constant competition between the various elements of traffic for the right of way.

If street cars are to meet this condition and hold their own in the general traffic movement they must be as mobile as other conveyances that use the streets.

An effective means of increasing car mobility is to provide brakes that will permit short stops, and the consequent longer period of peak speed operation and shorter running time between stops. With ordinary brakes, however, the retarding force which is satisfactory for the empty car is less effective when the car is loaded, so that the stopping distance lengthens, and this usually happens just when other vehicles are also contending for the right of way.

The Westinghouse Variable Load Brake was designed to correct this condition. It automatically adjusts the retarding force as the weight varies, so that the stopping distance is constant throughout the range of car loading. This results in accelerated transportation service just when the greatest possible hauling capacity is needed most.

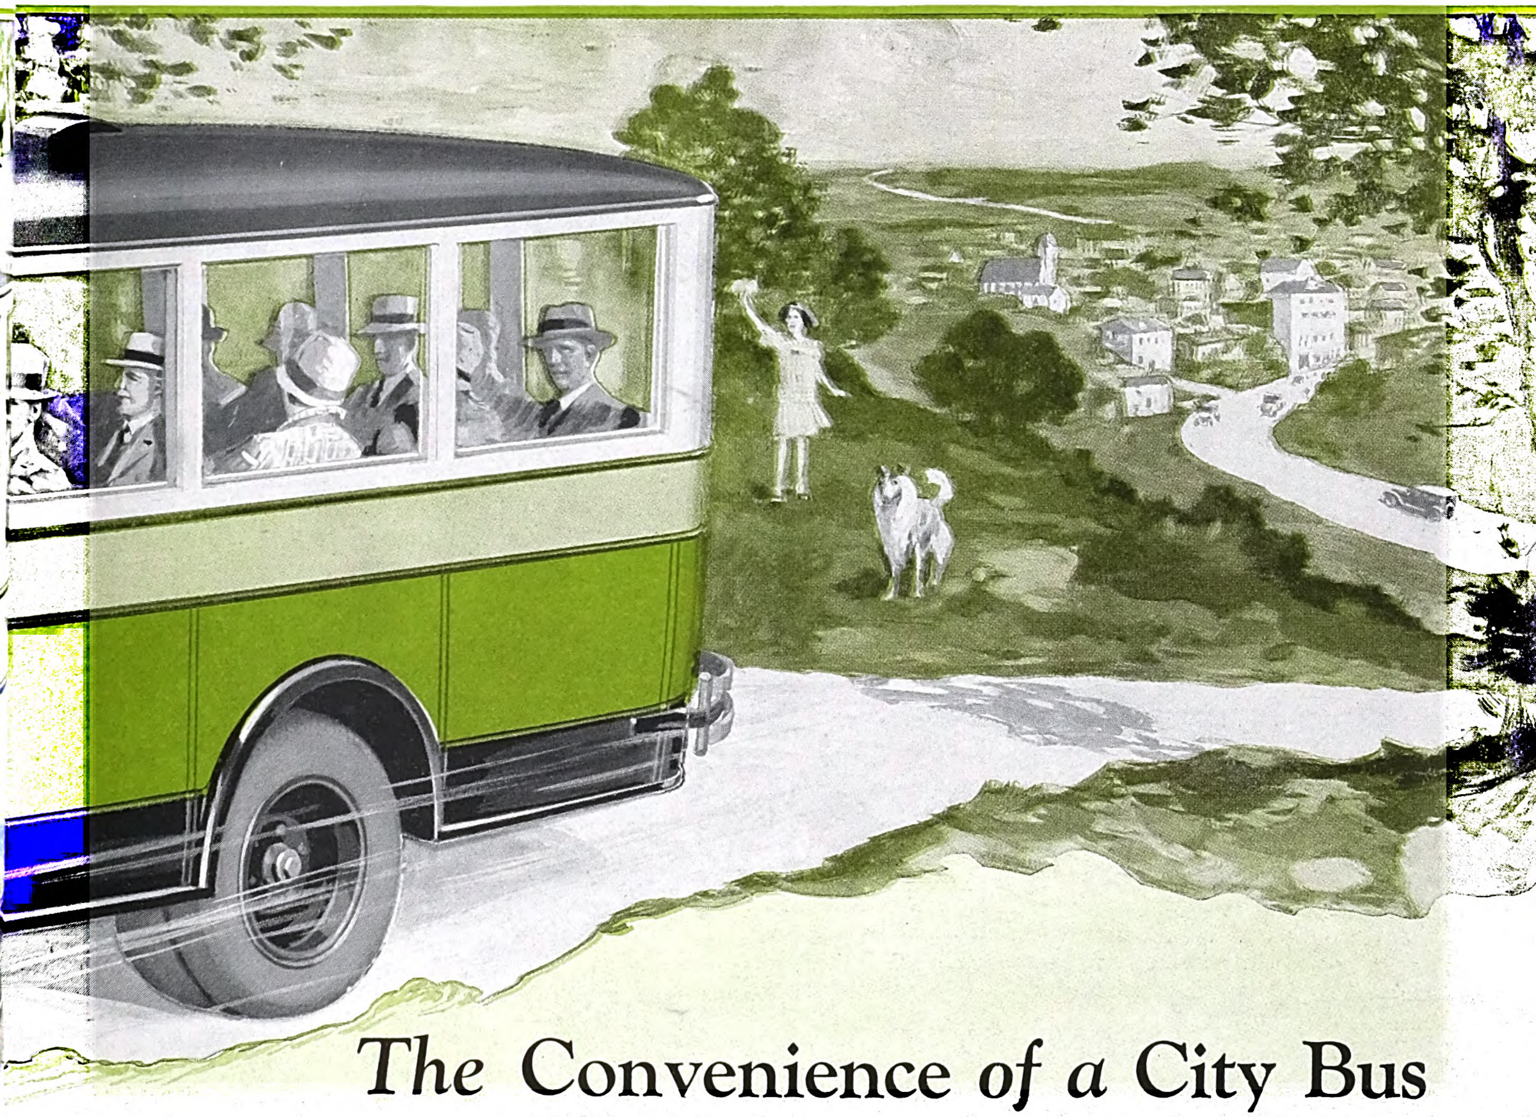
Studebaker Busses cost less to buy— less to operate and less to maintain

ASK any Studebaker bus operator why he bought Studebakers and he will tell you that Studebaker busses give greater profits with less invested capital. For instance, Chas. F. Egli, manager of the White Star Line, Washington, Pa., operating 17 Studebaker busses and 4 truck-type busses says: "The 5 new Studebaker parlor cars recently added to our fleet were purchased because we have demonstrated that Studebaker equipment costs considerably less to operate and maintain and the initial cost is most attractive. The splendid appearance of our Studebakers attracts new patronage while their dependability permits us to operate our line on a definite schedule and comfortable riding qualities hold the good will of the riding public."

The New Studebaker 75

with Studebaker Equipment



The Convenience *of a* City Bus *with* Parlor Car Luxury

OPERATORS covering routes which pass through or join medium-size cities must necessarily give a combination city and inter-city service. Studebaker has anticipated the needs of inter-city bus operators and offers in the new Studebaker Inter-City Coach De Luxe a unit which contains many features that are far in advance of the current practice in bus design. In reality it is a new type of vehicle of marked beauty possessing city bus convenience and parlor car luxury.

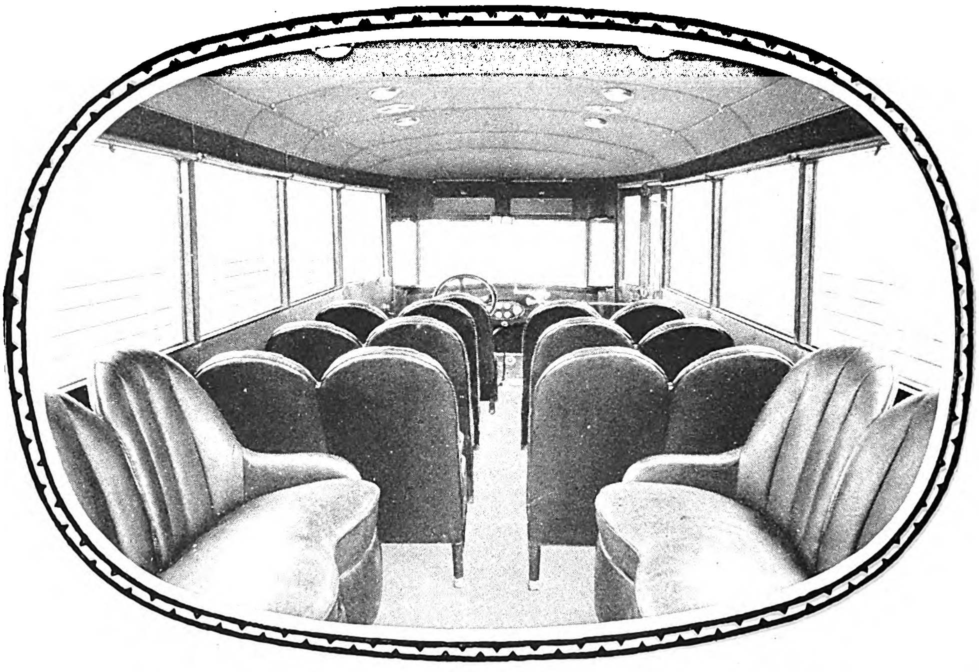
Superlative Comfort

For city service this De Luxe Coach meets present day traffic problems by providing an exclusive conveyance which will appeal to the better class of riders who are not interested in the ordinary truck-type bus. On inter-city routes it wins public preference because of the superlative comfort of the luxurious leather lounging seats spaced to provide ample leg room. Its extra large windows give uninterrupted vision; the spacious interior gives a greater sense of roominess than is found in the ordinary parlor coach.

Speed with Safety

Because of its abundant power and effortless steering, it is as easy to drive this coach as it is to drive an ordinary passenger car. According to the Society of Automotive Engineers' rating it has the most powerful bus chassis of its size and weight in the world. Loaded to capacity this coach glides quietly along the highway at permitted speeds with a smoothness alone attainable by a perfectly balanced mechanism and a power plant which is practically vibrationless. Smooth-acting four-wheel mechanical brakes of the self-energizing type enable the driver to safely negotiate heavy city traffic or ease around sharp curves with perfect safety. While traveling at 40 miles per hour this coach can be stopped in 71 feet, or in twice its own length at 20 miles per hour.

Heavy Duty Bus Chassis



Looking forward from the club section of the Inter-City Coach De Luxe. Note the deep, leather upholstered seats; ample aisle and head room.

Beauty and Dependability of Studebaker Busses Win Discriminating Riders

CARRIED in its own sub-frame is the famous Studebaker L-head motor, quiet, powerful and of notably long life. The transmission has four speeds forward and one reverse, giving greater driving range without excessive engine speeds, a feature of particular advantage in city operation and in hilly country or on long fast schedules.

Studebaker engineers have incorporated in the new Studebaker Inter-City Coach De Luxe every feature necessary for economy of operation and the safety and comfort of the riders. Passengers are naturally attracted to Studebaker busses because of their clean-cut appearance and regularity of service. The new Inter-City Coach De Luxe is a most distinctive looking bus. The black enamel fenders and disc steel wheels contrast sharply with the body. A wide letter strip is set off with two striped mouldings which carry out the stream-line effect from the cowl and hood. Heavy nickel-plated bumpers front and rear; nickel-plated radiator; spare tire carrier on the left; automatic windshield cleaner; and rear-vision mirror are standard equipment.

Prices of Studebaker Busses

Studebaker "75" Chassis only*	$3275.00
Studebaker "75" Parlor Observation Car*	6895.00
Studebaker "75" 21 Passenger Street Car bus*	5895.00
12 Pass. (including driver) cross-seat Sedan-Type	3935.00
15 Pass. (including driver) cross-seat Sedan-Type	4295.00
19 Pass. (including driver) cross-seat Sedan-Type	5050.00
18 Pass. (including driver) side entrance ParlorCar	5300.00
20 Pass. (including driver) Parlor Car De Luxe*	6150.00

*Includes dual rear wheels.

All prices f. o. b. factory. Purchase can be arranged on Liberal Budget Payment Plan.

Correct Ventilation and Heating

Proper ventilation and heating are two scientific problems that have been mastered in this new coach. Side windshield ventilators and two roof ventilators keep the air in constant motion. The wide windows held in grooves of deep felt are easily adjusted. In cold weather a constant flow of warm air from raised floor radiators insures an even distribution of heat.

Mounted on the Studebaker "75" Bus Chassis

The proved mechanical excellence of the "75" heavy duty chassis enables bus operators to meet time table schedules with due regularity. This chassis of 184 inches has nine heavy cross-members including two 3-inch tubular units at the center which give great rigidity to the frame. Every unit in this chassis, including the four-speed transmission, large double plate clutch, universal joints and extra heavy rear axle, is designed and built to give giant strength.

The appeal of appearance! Passenger Preference! Public Interest and Friendship!

At last year's Convention these phrases indicated a very definite trend of thought in our industry. This year they will be uttered again with a strong conviction of their importance. Operators now have plenty of proof that progressive merchandizing of electric railway service produces results.

Further than this, operating statistics from many of the most successful modernized properties prove that Cincinnati BALANCED DESIGN has produced cars so attractive, so thoroughly modern and so distinctive that public approval becomes a certainty.

BALANCED DESIGN does more. It establishes a principle of car building of proved soundness from the viewpoint of operating economy.

When you buy Cincinnati Lightweight NEW Cars you make no experiments. Tangible results can be predicted with more than usual certainty.

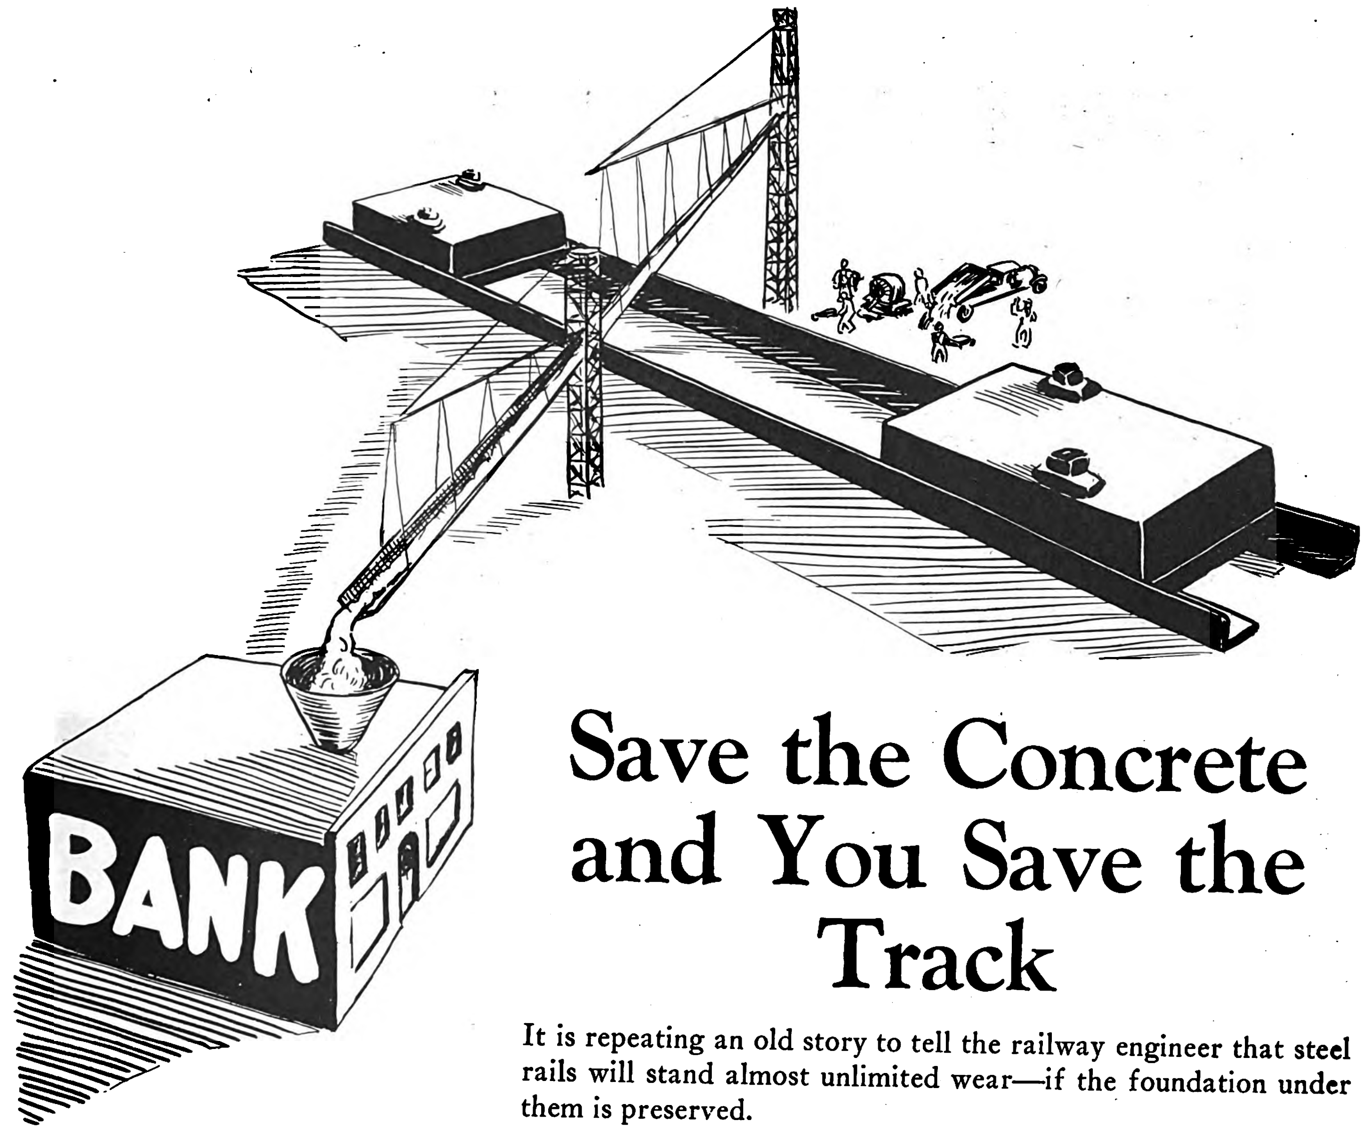
CARS

A step ahead of the modern trend



Save the Concrete and You Save the Track

It is repeating an old story to tell the railway engineer that steel rails will stand almost unlimited wear—if the foundation under them is preserved.

But, because track foundation under paving cannot be constantly ballasted up as steam roads do, the only recourse for street railways is concrete foundation.

But concrete track foundation does not stand vibration. Some means must be provided to absorb the vibration of the cars running over the track.

The answer—Dayton Ties, of course.

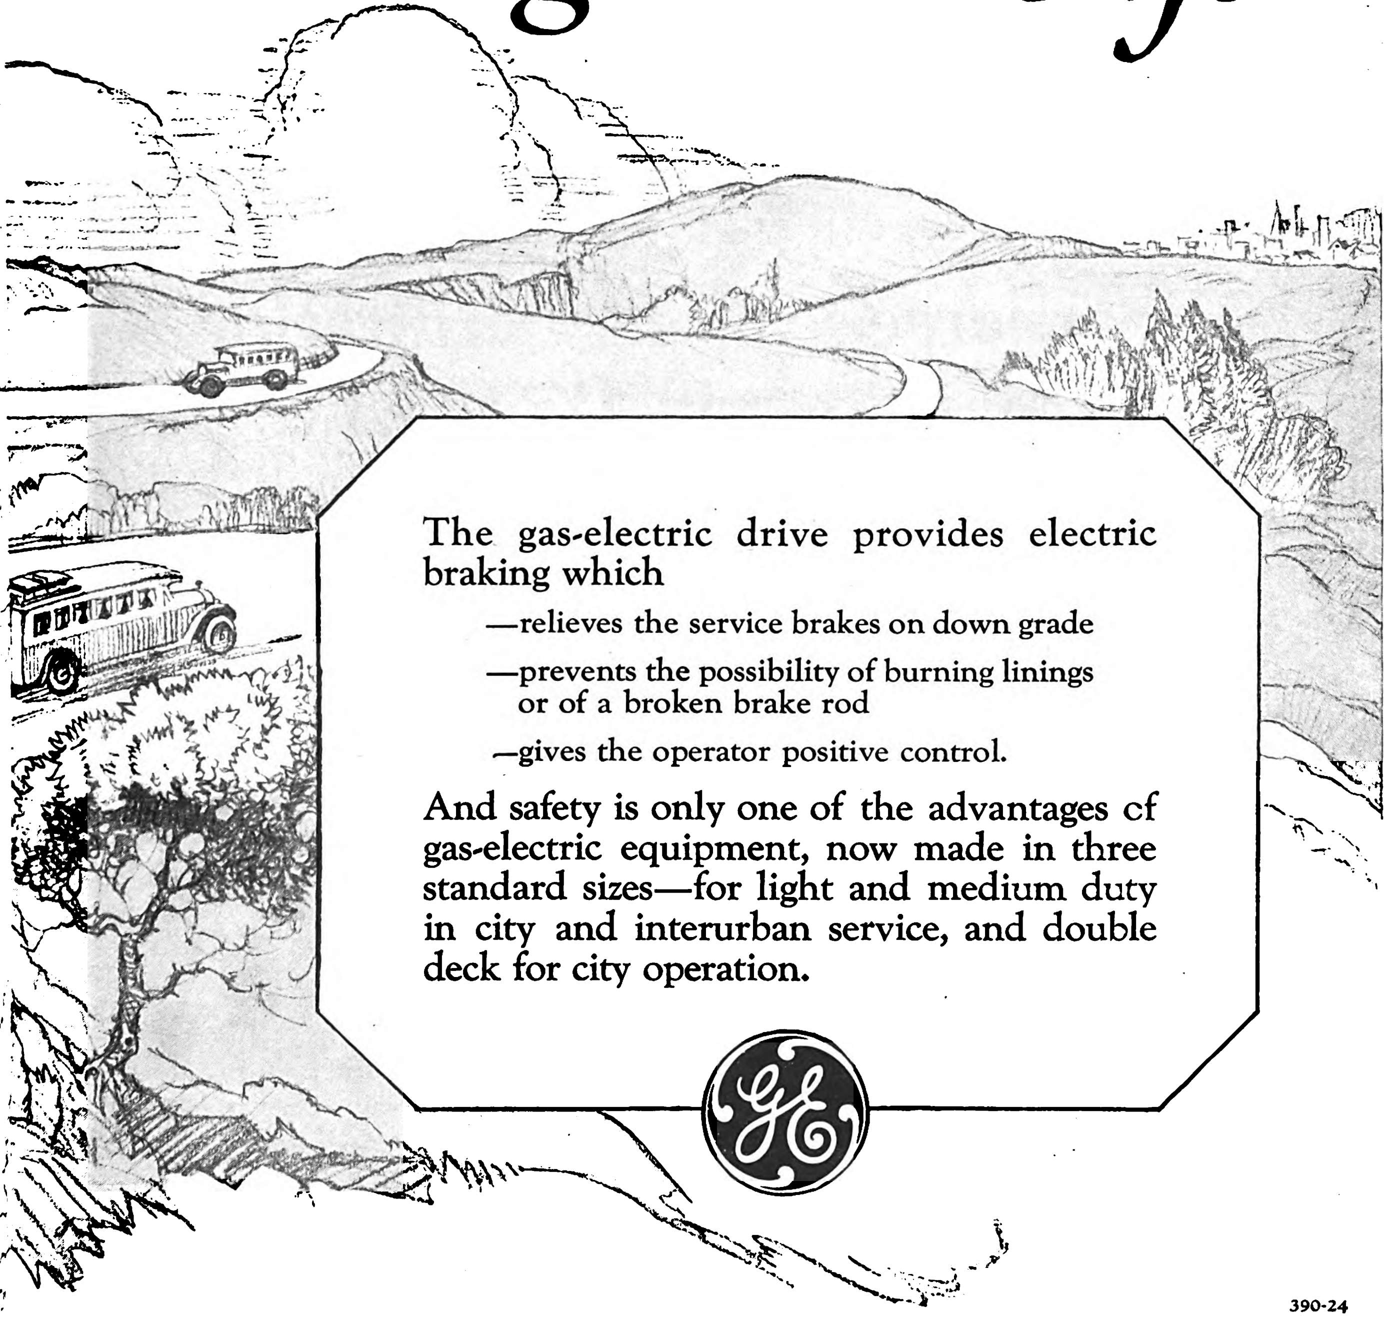
Designed and constructed to completely absorb this vibration, they have clearly demonstrated their ability to do so for years. Since the inception of Dayton Ties fifteen years ago, more than 125 cities have put in one to ten installations each, and not a foot of it has ever failed, or cost a penny of maintenance.

Where track has been opened—the concrete foundation, the ties and rails have always been in perfect condition—not a sign of deterioration.

The Dayton Mechanical Tie Co.

DAYTON, OHIO

DRIVE makes down-grades *safe*



The gas-electric drive provides electric braking which

—relieves the service brakes on down grade

—prevents the possibility of burning linings or of a broken brake rod

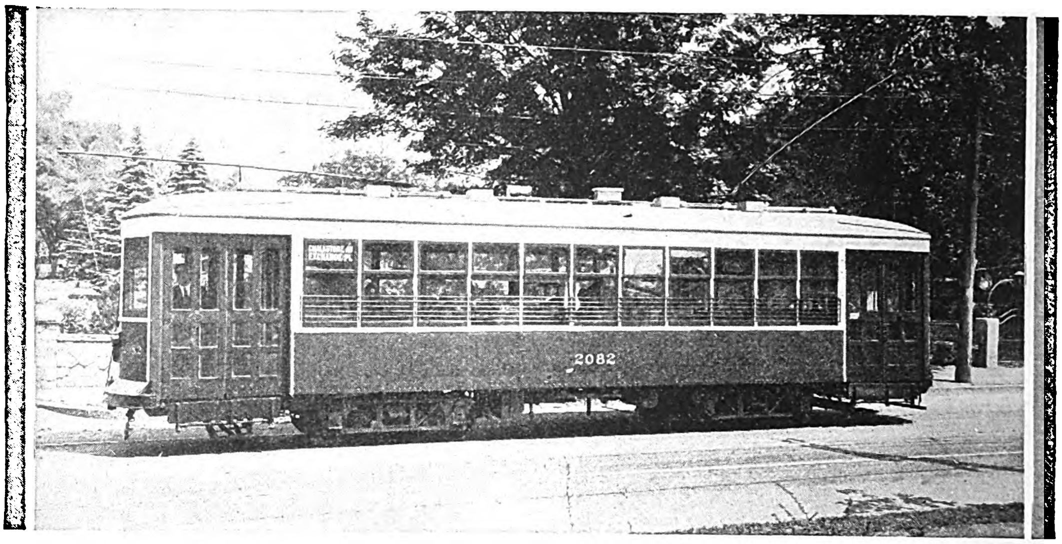
—gives the operator positive control.

And safety is only one of the advantages of gas-electric equipment, now made in three standard sizes—for light and medium duty in city and interurban service, and double deck for city operation.

390-24

ELECTRIC

SALES OFFICES IN PRINCIPAL CITIES



The 175 modern cars in Providence, R. I., are each equipped with four GE-265 Motors and K-Control. These 700 G-E Motors are among the 40,000 modern motors that are helping electric railways to give dependable service.

What large-scale modernization has done in Providence

Since 1921 the United Electric Railways Company, Providence, R. I., has placed in operation 175 modern cars—79% of its cars in basic service. These had made about 13,800,000 car-miles prior to Jan. 1, 1926.

In 1925 operating costs were 36.77 cents per car-mile, compared with 39.91 in 1921, and this even though a complete overhauling of cars has been in progress for 1½ years.

Maintenance costs per car-mile for Account No. 30 (passenger and combination cars) and for Account No. 33 (electrical equipment) were reduced respectively 10% and 20% for 1925 as compared with 1921.

Pull-ins per 1,000 miles were reduced to 0.292 in 1925, as compared with 0.67 for 1921, a reduction of more than 50%.

The greatest saving has been the reduction of nearly 20% in platform expense, although two-man car operators now receive 9% higher and one-man car operators nearly 20% higher wages.

The Providence management found that modern one-man, two-man cars transport passengers more safely and more economically; that they are superior to its converted one-man cars because they accelerate faster, consume less power, and reduce track wear; that they reflect favorably on the company and on the community.

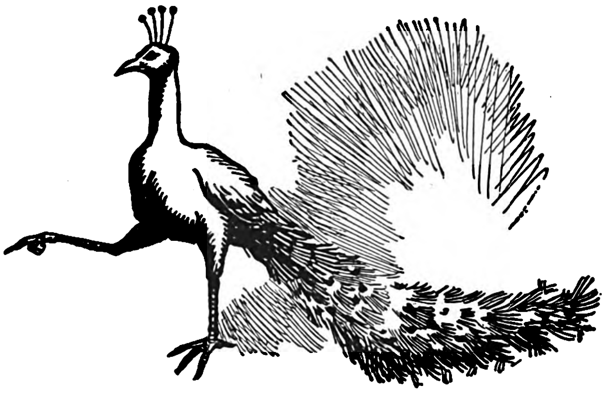
Have you ever asked why the superiority of some things is never questioned?



Here is the answer

Acknowledged superiority is won through long continued and unfailing performance. The acknowledgment takes the mighty eloquent form of universal use.

Peacock Staffless Brakes are found on most of the modern cars in use today. Why? They are fast, they have three times the braking power of ordinary equipment. They guarantee the meeting of an emergency.

The entire story of Peacock Staffless Brakes will take a little more time to tell than you can spend right now. Write us for their record and let us have the data upon which to base an estimate showing what your installation will cost.

What SUPERTWIST Adds to Goodyear Tires

In Yellowstone National Park, the tires used exclusively by the Yellowstone Park Transportation Company are Goodyear Tires of the type illustrated here—the Goodyear Heavy Duty All-Weather Tread Pneumatic

You know what rugged strength and long life have always been built into Goodyear Pneumatic Bus Tires.

Now you may confidently expect even greater service from Goodyears in motorbus service, because Goodyear Pneumatic Bus Tires are now made with SUPERTWIST.

SUPERTWIST is the extra elastic, extra enduring new material specially developed by Goodyear for Goodyear balloon tires, motorbus and heavy duty cord tires.

It far outstretches ordinary cotton cord, and has a maximum flexing power that yields under impact, protecting the tire from rupture, stone bruise and other injuries. It thus insures virtually *double* the *carcass* life of the tire.

Other exclusive features of the Goodyear Pneumatic Tire construction for motorbus service are (1) the new Goodyear band-building method; (2) the new Goodyear breaker; (3) the new Goodyear bead—patent applied for, and (4) the famous All-Weather Tread.

These advantages you get only in Goodyear Pneumatic Bus Tires—the only motorbus tires made of SUPERTWIST.

They are real advantages, because they result in the utmost durability, tractive power, road safety, riding comfort and long, trouble-free mileage at low cost.

Goodyear Means Good Wear

GOODYEAR

A straight line is the shortest distance between two points

CLEVELAND PNEUMATIC TOOL CO
CLECO
GRUSS
CLEVELAND, O

LOWER maintenance cost—longer life of chassis and body! These are the two points every fleet owner concedes as vital in the profitable operation of motor trucks and busses.

Air Springs are the straight line—the sure, smooth road . . . . the shortest distance between these points. Air Springs float the chassis on cushions of air that absorb the road shocks and vibration—check and practically eliminate all recoil.

From thousands of bus and truck operators who have adopted Air Springs as standard equipment come amazing records of far less breakage and repair bills—of cargoes protected against damage due to shifting—of increased bus patronage due to supreme riding comfort—of lengthened life of chassis and body.

The savings thus effected soon pays for the small initial cost of Air Springs. Thereafter they pay regular dividends on the total investment of your trucks and busses for years—and years—and years.

The Foremost Insurance Companies offer you

REDUCED PREMIUMS

on your Public Liability Insurance

if you reduce accidents

The opposite page tells you how you can save money through the Experience Rating Plan.

Protex GLASS for SAFETY

means MORE *safety* LESS *accidents* LOWER *premiums*

If you own 5 or more busses and pay over $1,000 a year for Public Liability Insurance the old line companies calculate your premium with regard to the losses you caused during the previous two years. If during successive years you show a decrease in accidents you get a lower premium under their Automobile Experience Rating Plan.

PROTEX GLASS is the only motor bus protective glass on the market economically possible for motor bus safety. It will not scatter. It is brilliant, solid, and will not discolor. A fine strand of steel wire, solidly imbedded in the glass and running horizontally every two inches holds the pieces together when the glass breaks. There is no flying glass! And 65% of all collision injuries are flying glass injuries.

PROTEX will reduce the number of your accidents. It will save you money on your public liability premiums.

We shall be glad to quote you on your requirements. Begin now to earn lower premiums under the Experience Rating Plan of the *foremost insurance companies in America.*

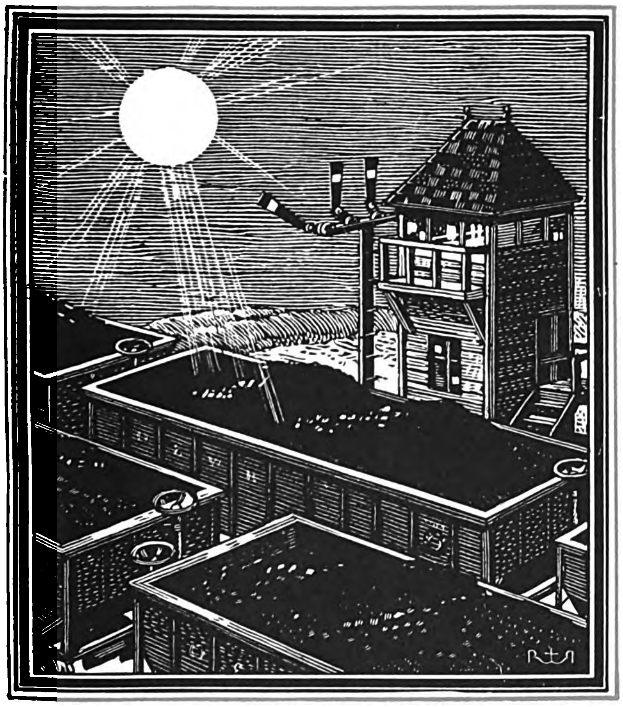
Edwards Metal Sash

Sold 140 Carloads of coal— *in hot weather*



IT WAS SWELTERING May weather in Omaha—a bad time, you might think, to sell coal. Yet a coal company manager and his assistant compiled a list of 200 dealers in Nebraska, Iowa and Missouri who were good winter customers. Two men in three days made the calls, the charges approximating $200. They sold 140 carloads, $21,000 worth. Ordinarily it took three salesmen two months to cover this same territory. Never before in hot weather had sales run so high.

FROM ALL KINDS OF BUSINESSES come reports of the use of long distance calls to get more accomplished, at less cost. Sometimes a task can be done in days by telephone that otherwise would take months. Business can be secured that otherwise would be lost. Salesmen and executives can conserve their productive time and so increase the good results of their work.

Long Distance is as important to inter-community and inter-sectional business as the local telephone is to local affairs. How can any business concern reach its greatest development without a regular use of long distance calls?

Anywhere is as close as your telephone. Is there some distant call that should be made now? You'll be surprised how little it will cost. . . . . . *Number, please?*

BELL LONG DISTANCE SERVICE

a smooth track area condition at the rail"

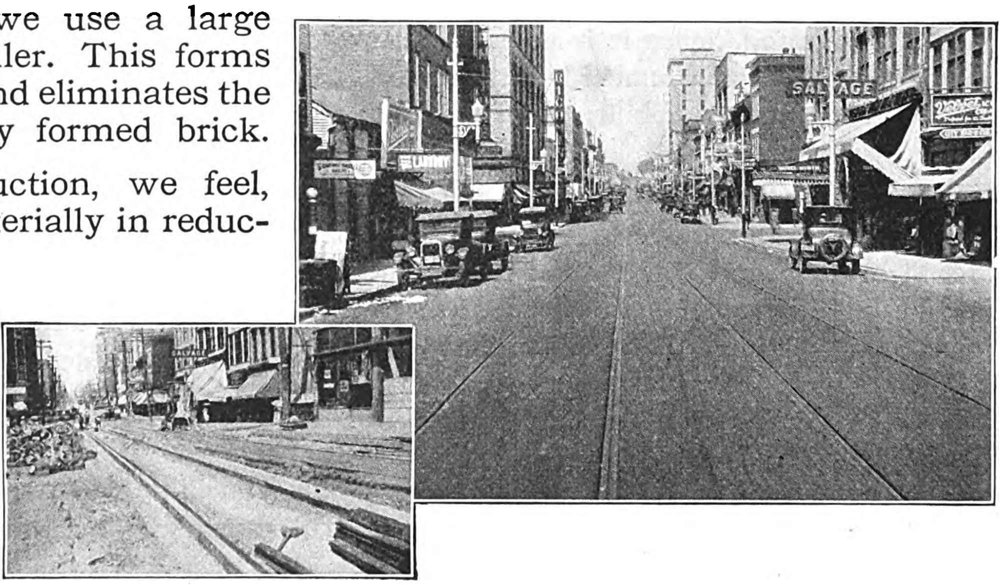
"WHERE brick construction is used," said Chas. T. Long, Resident Engineer of the Public Service Company, Portsmouth, Ohio, "the installation and maintenance of street railway tracks present some rather unique problems.

"We have accomplished much toward the solution of these difficulties by using an asphaltic cushion between the rails and the brick. This method of construction gives us a square, flat surface against which to lay the brick, and a water-tight condition at the rail, as well. Then, inside the rail, we use a large section of rail filler. This forms our flangeway and eliminates the need for specially formed brick.

"Such construction, we feel, has aided us materially in reducing track noise, and in keeping the track area smooth."

It is significant that in Carey Elastite System of Track Insulation, the Portsmouth Public Service Company has found the solution to their difficulties, as Mr. Long points out above. Write for full information about this remarkable development.

The Philip Carey Company
Lockland, Cincinnati, Ohio



Views of the Portsmouth Public Service Company tracks on Chillicothe Street, Portsmouth, Ohio. In the photo of the finished tracks, note the excellent condition of the flangeway and the smooth surface in the track area.

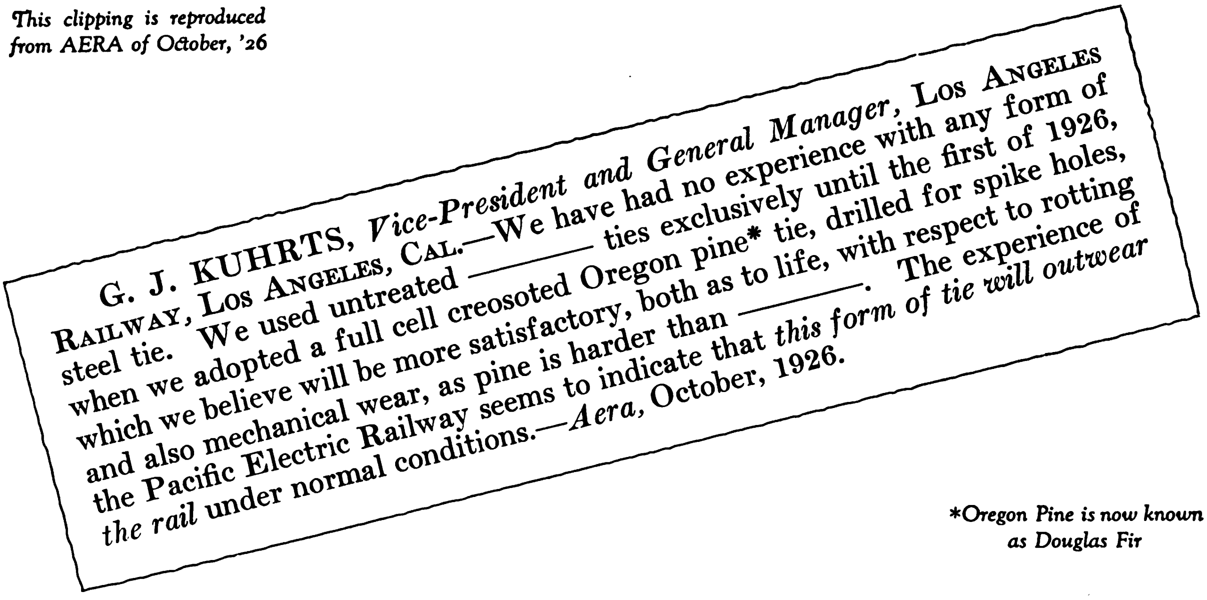
TRADE MARK REGD. U.S. PATENT OFFICE
SYSTEM OF TRACK INSULATION

This clipping is reproduced from AERA of October, '26



G. J. KUHRTS, *Vice-President and General Manager*, LOS ANGELES RAILWAY, LOS ANGELES, CAL.—We have had no experience with any form of steel tie. We used untreated ——— ties exclusively until the first of 1926, when we adopted a full cell creosoted Oregon pine* tie, drilled for spike holes, which we believe will be more satisfactory, both as to life, with respect to rotting and also mechanical wear, as pine is harder than ———. The experience of the Pacific Electric Railway seems to indicate that *this form of tie will outwear the rail* under normal conditions.—*Aera*, October, 1926.

**Oregon Pine is now known as Douglas Fir*

Making durability *doubly* durable

DOUGLAS FIR stands high among woods in resistance to decay, being excelled in durability only by such woods as the cedars and cypresses. 85% to 90% of a Douglas Fir log is heartwood, hence it is an easy matter to obtain Douglas Fir lumber and timbers in *all heartwood* where durability under exposure is necessary.

The very properties of Douglas Fir that make it naturally durable—particularly its high heartwood content and its lack of permeability to water—also make preservative treatment more of a problem than with spongy woods. On the other hand, with woods of spongy grain that are easily creosoted, go coarse grain, large knots and lower strength values than in close-grained Douglas Fir.

But today the scientific treatment of Douglas Fir—doubling and tripling its durability—is a commercial process that has long since passed the experimental stage. Several plants are specializing on the preservative treatment of Douglas Fir, and numerous railroads have installed and are successfully operating apparatus for the same purpose. Proper methods of impregnation retain the inherent strength of Douglas Fir—and treated timbers can be used at the same working stresses as untreated—a factor of importance in connection with structural timbers.

When you require lumber and timbers—in any size and length—that must be strong and durable under adverse conditions, specify Douglas Fir—treated if you think it necessary. Douglas Fir is obtainable in every important lumber market—at a reasonable price.

We will be glad to send you complete technical data for your files, and to answer questions that may arise regarding the uses and treatment of Douglas Fir. *Address*, West Coast Lumber Bureau, 562 T Stuart Building, Seattle, Washington.

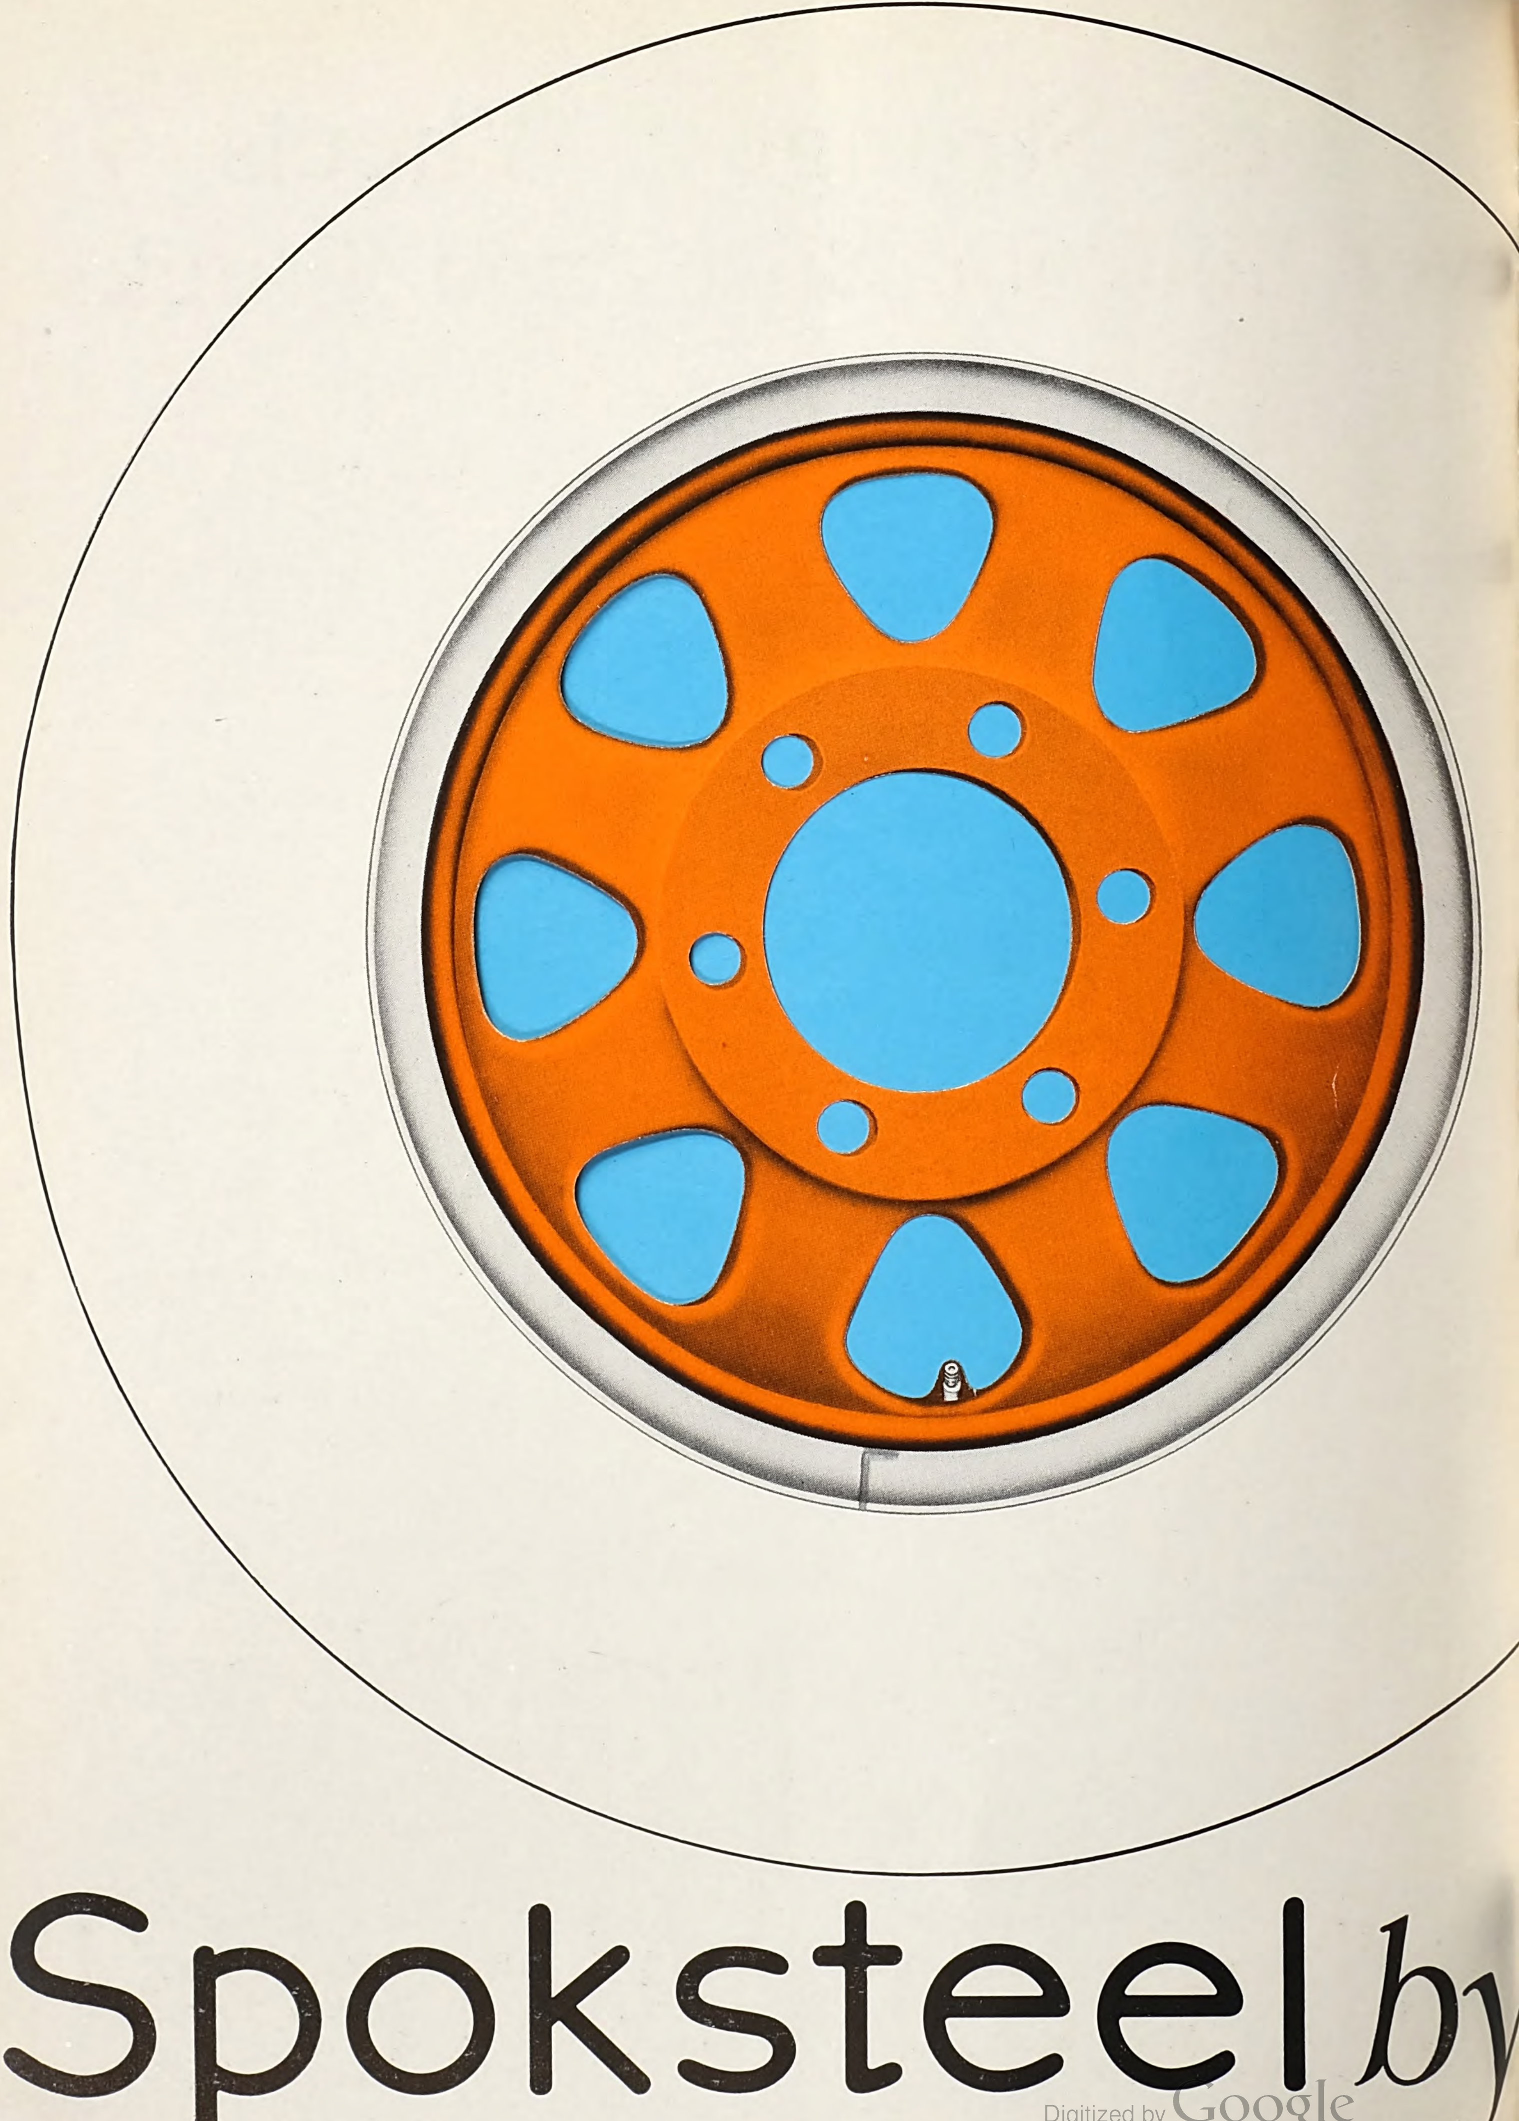
The Strongest Wheels ever built for Buses and Trucks



Spoksteel by

The Strongest Wheels ever built for Buses and Trucks

A Product of the World's Largest Wheel Manufacturers

Demountable at the Hub—Interchangeable on Hubs for Dual Steel Wheels

The Spoksteel wheel combines the super-strength of a one-piece forged steel wheel member with the convenience and other recognized advantages of spoke construction. No previous type of wheel has ever approached the Spoksteel average of durability, safety, weight-saving, coolness, quiet, easy maintenance, and fine appearance. This far-reaching advance is the result of years of development by Motor Wheel, world's largest wheel makers.

For the first time, highest grade material is used in a steel wheel. Strength is multiplied. Every form of stress is accurately distributed.

The mounting is as much better as the wheel itself. Larger studs are possible; they take no radial stress at all, and at least 50% less torque. Hence Spoksteel equipment assures the highest possible resistance to shock, looseness, and permanent deflection.

The inherent advantages of Spoksteel design and construction are fully realized in service, because these wheels must mount perfectly—there is no other way. All studs and nuts are right-hand; in dual mounting the inner wheels stay in place independently; and the final locking is positive.

Reducing depreciation, maintenance and labor costs, Spoksteel wheels also produce many indirect economies. Tires are protected by the excellent radiation properties of Spoksteel wheels. Proper inflation is encouraged because valves are accessible. Brake wear is less and adjustments are fewer because Spoksteel wheels can be kept clean on the inner side.

Wheel noises cannot develop in Spoksteel wheels, and chassis sounds are not magnified. Spoksteel silence and good looks are factors in attracting and holding bus business. Spoksteel design and construction assure lowest wheel and tire costs in handling the business.

It is another of the notable developments which are responsible for the clear leadership of Motor Wheel. A test set of Spoksteel wheels—readily applied to standard hubs—will reveal new possibilities for improving production and operation of buses and trucks of every type.

MOTOR WHEEL CORPORATION, LANSING, MICHIGAN

Motor Wheel

Strongest

Easiest Mounting, Inflation, Cleaning and Care

High Carbon Forged Steel

The practical application of this far better wheel material was made possible only by Motor Wheel experience and facilities. Spoksteel wheels are far stronger without excess weight—important in reducing tonnage—and vital in relieving tires.

Cool Running

The spoked design, character of material, rim application, and mounting of Spoksteel wheels all tend to improve radiation. Impartial competitive tests have recorded the ability of Spoksteel wheels to keep tires many degrees cooler—much further below critical temperatures.

Perfect Mounting

Piloted to hubs, Spoksteel wheels assure best load distribution over greatest possible area. The studs used greatly exceed standard strength, carry no radial load, and only a fraction of the torque. Broken studs, chewed-up holes and cracked wheels become a thing of the past.

Positive Locking

The Spoksteel locking flange is a development of the pioneer Motor Wheel design which has been one of the chief factors in the general success of steel wheels. Complication and delicate parts are eliminated. Incorrect application is quite impossible. Wheel changes are facilitated because spoke-type wheels are always more easily handled. And in dual service the inner Spoksteel wheel stays in place positively while the second wheel is applied. Both wheels lock with one operation.

Silence, Cleanliness, Convenience

Spoksteel wheels are permanently silent and they do not "cage" or magnify other chassis sounds. Dirt is not stored up and dumped into the brakes. Tire inflation is easy and quick. In emergencies, wheel repairs can be properly made without special costly machinery or factory facilities.

Single and Dual

The full advantages of pneumatic tires are now available for every operator of buses or trucks. An experimental set of Spoksteel wheels—single and dual—will set up new figures for low-cost and high-mileage.

“WELD PLATES”

For EFFICIENT, ECONOMICAL

JOINTS

Do you believe in statistics? Rely on performance records? If so the performance records of the many “Weld Plates” now in use will convince you that they lead the bar-weld joints in efficiency and economy.

“Weld Plates” represent the most modern welding practice. They are the strongest and most up-to-date plates rolled especially for electric welded joints. Note the shape—the grooves for retaining plenty of weld metal along the upper edges—the wide contact areas at top and bottom—the suitability for the use of short bolts.

A trial will convince you of their efficiency and economy.

US 20A base with Timken Bearings

Ever Grease a Trolley Base?

If you have ever greased one of the older types, you will appreciate the lubrication features of the US 20A trolley base. The base contains reservoirs which require filling but once every six months; and then all that is necessary is to remove a pipe plug and replenish the lubricant. The lubrication of the working parts of the US 20A is positive and reliable at all times.

The lubricant is securely held in an upright metal cup from which it is impossible for it to leak out and deface the car roof. This is accomplished without the use of leather gaskets or other makeshift arrangements.

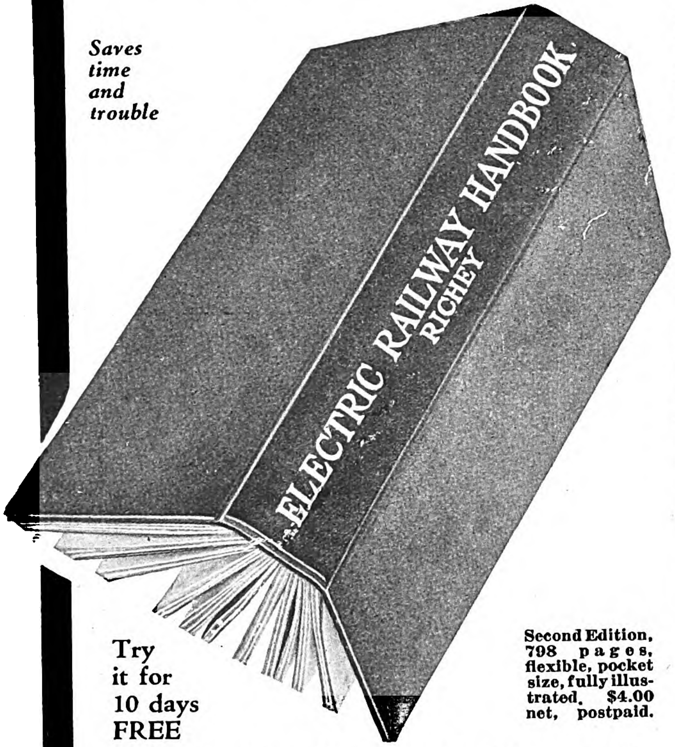
Right on your desk
—*just the data you want*

Electric railway executives, engineers and operating men have long respected Richey's ELECTRIC RAILWAY HANDBOOK as the one great pocketbook of practice data, formulas and tables in the electric railway field.

The second edition of Richey covers the latest developments—describes new methods—records changes in theory and practice. It covers every phase of electric railway work from Roadbed and Track to Signals and Communication.

Saves time and trouble



Try it for 10 days FREE

Second Edition, 798 pages, flexible, pocket size, fully illustrated, $4.00 net, postpaid.

This widely-known handbook is virtually an encyclopedia, on modern electric railway organization, administration and operation.

It presents

(1) Data on subjects which come up in everyday electric railway practice for constant use by the operating, constructing and designing engineer.
(2) Material of service to the non-technical manager or operator.
(3) Reference material on electric railway practice for those who are specializing in other or allied fields.

Information every electric railway man needs—the latest and best methods—changes in practice and theory—that's the New Richey.

SEARCHLIGHT SECTION

POSITION VACANT

WELDING foreman. Must be thoroughly experienced in applying Lincoln seam welded joints and in general track reclamation work by welding methods. Give education and experience in detail in reply and submit references when requested. Replies will be held confidential. Work to be on a property in the New England States having about 175 miles of track in paved streets and also some tee rail. P-14, Electric Railway Journal, Tenth Ave. at 36th St., New York.

POSITIONS WANTED

ENGINEER, desires position as roadmaster or track superintendent. Experienced in steam road location and construction, also electric railway construction. Ability to handle men and get results. At present employed as track superintendent on electric railway. Correspondence invited. PW-16, Electric Railway Journal, Tenth Ave. at 36th St., New York.

POSITION wanted as superintendent. Have had more than 20 years' experience in both interurban and city operation. References furnished. PW-15, Electric Railway Journal, Tenth Ave. at 36th St., New York.

SUPERINTENDENT of railways, with 20 years' experience desires, for personal reasons, to make change. Nationwide reputation as railway operator, can take full charge. Has ability to handle men and show results. Correspondence invited and treated in confidence. PW-979, Electric Railway Journal, 7 So. Dearborn Street, Chicago, Ill.

OFFICIAL PROPOSALS

Bids: July 7.

Installing Contact Rail and Bonding Track Broad Street Subway

DEPARTMENT OF CITY TRANSIT
11th Floor, 1211 Chestnut St.
Philadelphia, Pa., June 23, 1927.

Sealed proposals, addressed to the undersigned, at the office above mentioned, will be received until 11 o'clock A.M. (Eastern Standard Time), on Thursday, July 7, 1927, and publicly opened immediately thereafter, for installation of the contact rail and the bonding of the track in the Broad Street Subway and Terminal Yard, Contract No. 164.

Specifications and plans may be seen at the office of the Department on the 12th floor, 1211 Chestnut Street, and copies of same, with blank forms for proposals, will be supplied to intending bidders upon application. A deposit of fifty (50) dollars will be required for the specifications and plans. This deposit will be refunded upon return of the specifications and plans in good condition.

Bidders must be skilled and regularly engaged in the class of work for which they are competing.

No bid will be considered unless accompanied by a certified check on a responsible bank or trust company in favor of the City of Philadelphia, to the amount of five (5) per cent of the sum of such bid, in accordance with the provisions of an ordinance approved March 7, 1924, as amended by ordinance approved July 2, 1924, and reprinted in full in the specifications.

The Director reserves the right to reject any or all bids, as he may deem best for the interest of the City of Philadelphia.

H. E. EHLERS,
Director.

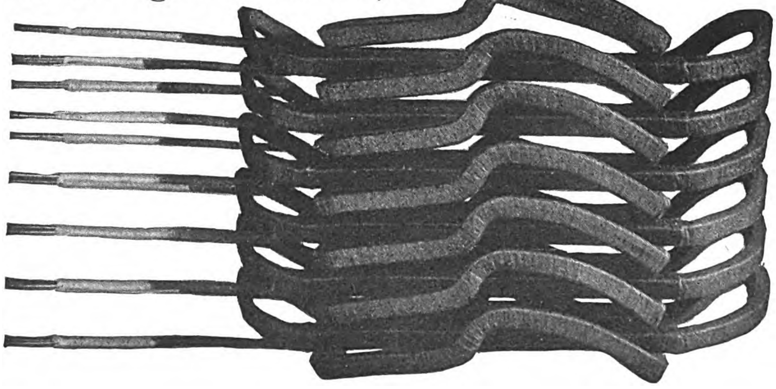
Right Installation Means Longer Coil Life



Thirty years' experience making coils has enabled us to develop a product second to none.

Our experience has taught us that proper installation reduces maintenance costs and insures longer coil life.

Write our engineering department. They will be glad to advise you as to the best methods of coil installation.

A Single Segment or a Complete Commutator

is turned out with equal care in our shops. The orders we fill differ only in magnitude; small orders command our utmost care and skill just as do large orders. CAMERON quality applies to every coil or segment that we can make, as well as to every commutator we build. That's why so many electric railway men rely absolutely on our name.

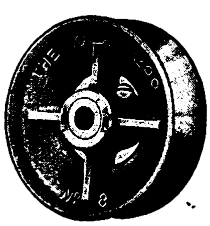
Kalamazoo Trolley Wheels

The value of Kalamazoo Trolley Wheels and Harps has been demonstrated by large and small electric railway systems for a period of thirty years. Being exclusive manufacturers, with no other lines to maintain, it is through the high quality of our product that we merit the large patronage we now enjoy. With the assurance that you pay no premium for quality we will appreciate your inquiries.



THE STAR BRASS WORKS
KALAMAZOO, MICH., U. S. A.

"Nick Lynt" says:
"No exhaust gases, no engine fumes."

"The construction of the N-L Heater prevents the entrance of exhaust gases and engine fumes into the body. All joints are heavily brazed, and the Heater is so suspended that strained joints are impossible."

The Widespread Introduction

of a comparatively new type of Brill Truck

The success which has attended the introduction of the Brill 177-E type truck for lightweight modern cars in such a short time is the best indication of its general all-round efficiency. Already an unusually large number of this type truck has been specified by the prominent electric railway systems listed below.

	No. of Trucks
Grand Rapids Railway Co	2
United Electric Railways of Providence	74
Pennsylvania-Ohio Company	26
East Taunton Street Railway	4
Virginia Electric & Power Co	60
Georgia Power Co	220
Cia Chilena de Electricidad, Santiago	62

The "Williamsport" front

Many railways have turned to Brill New Modern Cars

THAT the electric railway industry appreciates the importance of rolling stock modernization is reflected in the May issue of Brill Magazine. In the various types of cars illustrated, including modern light-weight city types for Williamsport, Richmond, Portsmouth, Norfolk, Wilkes-Barre, and Santiago, Chile, as well as the W. B. & A. high-speed articulated cars, is shown a strong tendency to take advantage of the increased revenue resulting from attractive appearance and comfort in addition to comparatively low operating costs obtained by the elimination of unnecessary weight. Many interesting features are embodied in these new types of Brill modern cars.

Brill Magazine gives in detail information on various types of cars built at Brill plants. Binders for preserving copies for future reference are provided without charge.

Send in your request card NOW.

Up to the minute

NEW conditions of load and road, new designs, new standards of performance—all these put new responsibilities on front axles. ℭ Timken sets the pace. Timken fronts are up-to-the-minute, with important new features; built to do their job, with adequate safety factor; the kind of product expected of Timken.
